7.2.51.20.2.4 system

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group System Reliability Mode (Group 1)	Dakota Keyword series	Dakota Keyword Description Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.51.20.2.5 series

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [series](#)

Aggregate response statistics assuming a series system

Specification

7.2.51.21 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
    1. .8 .5 0.
    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds    = 199.3, 474.63
  upper_bounds    = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas          = 12., 30.
  betas           = 250., 590.
  descriptors      = 'TF1w' 'TF2w'

Complementary Cumulative Distribution Function (CCDF) for response_fn_2:

Response Level	Probability Level	Reliability Index	General Rel Index
4.6431154744e+04	1.0000000000e+00		
5.6511827775e+04	8.0000000000e-01		
6.1603813790e+04	5.0000000000e-01		
7.8702465755e+04	0.0000000000e+00		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
2.3796737090e+05	1.0000000000e+00		
3.6997214153e+05	3.0000000000e-01		
3.8100966235e+05	2.0000000000e-01		
4.4111498127e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

Description

See parent page

7.2.51.24 `distribution`

- [Keywords Area](#)
- [method](#)

- [polynomial_chaos](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.51.24.1 cumulative

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)

- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.51.24.2 complementary

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.51.25 variance_based_decomp

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		interaction_order	Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

	Optional	<code>drop_tolerance</code>	Suppresses output of sensitivity indices with values lower than this tolerance
--	-----------------	-----------------------------	--

Description

Dakota can calculate sensitivity indices through variance-based decomposition using the keyword `variance_based_decomp`. This approach decomposes main, interaction, and total effects in order to identify the most important variables and combinations of variables in contributing to the variance of output quantities of interest.

Default Behavior

Because of processing overhead and output volume, `variance_based_decomp` is inactive by default, unless required for dimension-adaptive refinement using Sobol' indices.

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects, total effects, and any interaction effects will be reported. Each of these effects represents the percent contribution to the variance in the model response, where main effects include the aggregated set of *univariate* terms for each individual variable, interaction effects represent the set of *mixed* terms (the complement of the univariate set), and total effects represent the *complete* set of terms (univariate and mixed) that contain each individual variable. The aggregated set of main and interaction sensitivity indices will sum to one, whereas the sum of total effects sensitivity indices will be greater than one due to redundant counting of mixed terms.

Usage Tips

An important consideration is that the number of possible interaction terms grows exponentially with dimension and expansion order. To mitigate this, both in terms of compute time and output volume, possible interaction effects are suppressed whenever no contributions are present due to the particular form of an expansion. In addition, the `interaction_order` and `drop_tolerance` controls can further limit the computational and output requirements.

Examples

```
method,
  polynomial_chaos # or stoch_collocation
  sparse_grid_level = 3
  variance_based_decomp interaction_order = 2
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76]: "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [90].

7.2.51.25.1 `interaction_order`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)

- [variance_based_decomp](#)
- [interaction_order](#)

Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

Specification

Alias: none

Argument(s): INTEGER

Default: Unrestricted (VBD includes all interaction orders present in the expansion)

Description

The `interaction_order` option has been added to allow suppression of higher-order interactions, since the output volume (and memory and compute consumption) of these results could be extensive for high dimensional problems (note: the previous `univariate_effects` specification is equivalent to `interaction_order = 1` in the current specification). Similar to suppression of interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to again save compute and memory resources and reduce output volume)

7.2.51.25.2 `drop_tolerance`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,  
  sampling  
  sample_type lhs  
  samples = 100  
  variance_based_decomp  
  drop_tolerance = 0.001
```

7.2.51.26 diagonal_covariance

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: diagonal_covariance for response vector > 10; else full_covariance

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.51.27 full_covariance

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.51.28 import_approx_points_file

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)

Filename for points at which to evaluate the PCE/SC surrogate

Specification

Alias: none

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

Default Behavior No import of points at which to evaluate the surrogate.

Expected Output The PCE/SC surrogate model will be evaluated at the list of points (input variable values) provided in the file and results tabulated and/or statistics computed at them, depending on the method context.

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_approx_points_file = 'import.mcmc_annot.dat'
    annotated
```

7.2.51.28.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)

- [import_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.51.28.1.1 header

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [custom_annotated](#)
- [header](#)

Enable header row in custom-annotated tabular file

Specification

Alias: none

Argument(s): none

Default: no header

Description

See description of parent `custom_annotated`

7.2.51.28.1.2 eval_id

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [custom_annotated](#)
- [eval_id](#)

Enable evaluation ID column in custom-annotated tabular file

Specification

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [custom_annotated](#)
- [interface_id](#)

Enable interface ID column in custom-annotated tabular file

Specification

Alias: none

Argument(s): none

Default: no interface_id column

Description

See description of parent `custom_annotated`

7.2.51.28.2 annotated

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.51.28.3 freeform

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.51.28.4 active_only

- [Keywords Area](#)

- [method](#)
- [polynomial_chaos](#)
- [import_approx_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.51.29 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.51.29.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>header</code>	Enable header row in custom-annotated tabular file
	Optional		<code>eval_id</code>	Enable evaluation ID column in custom-annotated tabular file
	Optional		<code>interface_id</code>	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [export_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76

```

7.2.51.30 seed

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.51.31 `fixed_seed`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The

same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.51.32 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [polynomial_chaos](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```

environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                      0.1 0.2 0.6
                      0.1 0.2 0.6
  sample_type lhs

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)

Multifidelity uncertainty quantification using polynomial chaos expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		p_refinement	Automatic polynomial order refinement
	Optional		max_refinement_ - iterations	Maximum number of expansion refinement iterations
	Optional		convergence_ - tolerance	Stopping criterion based on objective function or statistics convergence
	Optional		metric_scale	define scaling of statistical metrics when adapting UQ surrogates
	Optional		statistics_mode	type of statistical metric roll-up for multifidelity UQ methods
	Optional		allocation_control	Sample allocation approach for multifidelity expansions
	Optional		discrepancy_ - emulation	Formulation for emulation of model discrepancies.
	Required (<i>Choose One</i>)	Chaos Coefficient Estimation Approach (Group 1)	quadrature_order_ - sequence	Sequence of quadrature orders used in a multi-stage expansion
			sparse_grid_level_ - sequence	Sequence of sparse grid levels used in a multi-stage expansion

			expansion_order_sequence	Sequence of expansion orders used in a multi-stage expansion
			orthogonal_least_interpolation	Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.
	Optional (<i>Choose One</i>)	Basis Polynomial Family (Group 2)	askey	Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.
			wiener	Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.
	Optional		normalized	The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials
	Optional		export_expansion_file	Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file

	Optional	samples_on_ - emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional	sample_type	Selection of sampling strategy
	Optional	rng	Selection of a random number generator
	Optional	probability_ - refinement	Allow refinement of probability and generalized reliability results using importance sampling
	Optional	final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	reliability_levels	Specify reliability levels at which the response values will be estimated
	Optional	gen_reliability_ - levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions

	Optional		variance_based_decomp	Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects
	Optional (<i>Choose One</i>)	Covariance Type (Group 3)	diagonal_covariance	Display only the diagonal terms of the covariance matrix
			full_covariance	Display the full covariance matrix
	Optional		import_approx_points_file	Filename for points at which to evaluate the PCE/SC surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional		model_pointer	Identifier for model block to be used by a method

Description

As described in [polynomial_chaos](#), the polynomial chaos expansion (PCE) is a general framework for the approximate representation of random response functions in terms of series expansions in standardized random variables:

$$R = \sum_{i=0}^P \alpha_i \Psi_i(\xi)$$

where α_i is a deterministic coefficient, Ψ_i is a multidimensional orthogonal polynomial and ξ is a vector of standardized random variables.

In the multilevel and multifidelity cases, we decompose this expansion into several constituent expansions, one per model form or solution control level. In a bi-fidelity case with low-fidelity (LF) and high-fidelity (HF) models and an additive discrepancy approach, we have:

$$R = \sum_{i=0}^{p^{LF}} \alpha_i^{LF} \Psi_i(\xi) + \sum_{i=0}^{p^{HF}} \delta_i \Psi_i(\xi)$$

where δ_i is a coefficient for the discrepancy expansion.

The same specification options are available as described in [polynomial_chaos](#) with one key difference: many of the coefficient estimation inputs change from a scalar input for a single expansion to a *sequence* specification for a low-fidelity expansion followed by multiple discrepancy expansions.

To obtain the coefficients α_i and δ_i for each of the expansions, the following options are provided:

1. multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order_sequence`, and, optionally, `dimension_preference`).
2. multidimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level_sequence` and, optionally, `dimension_preference`)
3. multidimensional integration by Latin hypercube sampling (specified with `expansion_order_sequence` and `expansion_samples_sequence`).
4. linear regression (specified with `expansion_order_sequence` and either `collocation_points_sequence` or `collocation_ratio`), using either over-determined (least squares) or under-determined (compressed sensing) approaches.
5. orthogonal least interpolation (specified with `orthogonal_least_interpolation` and `collocation_points_sequence`)

It is important to note that, while `quadrature_order_sequence`, `sparse_grid_level_sequence`, `expansion_order_sequence`, `expansion_samples_sequence`, and `collocation_points_sequence` are array inputs, only one scalar from these arrays is active at a time for a particular expansion estimation. In order to specify anisotropy in resolution across the random variable set, a `dimension_preference` specification can be used to augment scalar specifications for quadrature order, sparse grid level, and expansion order.

Multifidelity UQ using PCE requires that the model selected for iteration by the method specification is a multifidelity surrogate model (see [hierarchical](#)), which defines an `ordered_model_sequence` (see [hierarchical](#)). Two types of hierarchies are supported: (i) a hierarchy of model forms composed from more than one model within the `ordered_model_sequence`, or (ii) a hierarchy of discretization levels comprised from a single model within the `ordered_model_sequence` which in turn specifies a `solution_level_control` (see [solution_level_control](#)).

In both cases, an expansion will first be formed for the low fidelity model or coarse discretization, using the first value within the coefficient estimation sequence, along with any specified refinement strategy. Second, expansions are formed for one or more model discrepancies (the difference between response results if `additive_correction` or the ratio of results if `multiplicative_correction`), using all subsequent values in the coefficient estimation sequence (if the sequence does not provide a new value, then the previous value is reused) along with any specified refinement strategy. The number of discrepancy expansions is determined by the number of model forms or discretization levels in the hierarchy.

After formation and refinement of the constituent expansions, each of the expansions is combined (added or multiplied) into an expansion that approximates the high fidelity model, from which the final set of statistics are generated. For polynomial chaos expansions, this high fidelity expansion can differ significantly in form from the low fidelity and discrepancy expansions, particularly in the `multiplicative` case where it is expanded to include all of the basis products.

Additional Resources

Dakota provides access to multifidelity PCE methods through the `NonDMultilevelPolynomialChaos` class. Refer to the Stochastic Expansion Methods chapter of the Theory Manual [16] for additional information on the Multifidelity PCE algorithm.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Integration and Expansion Moments](#) (expansion moments only)

- [Probability Density](#)
- [Level Mappings](#)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Examples

```
method,
  multifidelity_polynomial_chaos
  model_pointer = 'HIERARCH'
  sparse_grid_level_sequence = 4 3 2

model,
  id_model = 'HIERARCH'
  surrogate hierarchical
  ordered_model_fidelities = 'LF' 'MF' 'HF'
  correction additive zeroth_order
```

7.2.52.1 p_refinement

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.

			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.
--	--	--	------------------------------------	--

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

7.2.52.1.1 uniform

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)
- [uniform](#)

Refine an expansion uniformly in all dimensions.

Specification

Alias: none

Argument(s): none

Description

The quadrature_order or sparse_grid_level are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the uniform refinement case with regression approaches, the expansion_order is ramped by one on each iteration while the oversampling ratio (either defined by collocation_ratio or inferred from collocation_points based on the initial expansion) is held fixed.

7.2.52.1.2 dimension_adaptive

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)
- [dimension_adaptive](#)

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Dimension Adaptivity Estimation Approach (Group 1)	sobol	Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.

			decay	Estimate spectral coefficient decay rates to guide dimension-adaptive refinement.
			generalized	Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Description

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to hold higher 'importance' in resolving statistical quantities of interest.

Dimension importance must be estimated as part of the refinement process. Techniques include either sobol or generalized for stochastic collocation and either sobol, decay, or generalized for polynomial chaos. Each of these automated refinement approaches makes use of the max_iterations and convergence_tolerance iteration controls.

7.2.52.1.2.1 sobol

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)
- [dimension_adaptive](#)
- [sobol](#)

Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.

Specification

Alias: none

Argument(s): none

Default: generalized

Description

Determine dimension preference for refinement of a stochastic expansion from the total Sobol' sensitivity indices obtained from global sensitivity analysis. High indices indicate high importance for resolving statistical quantities of interest and therefore result in high dimension preference.

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement sobol
  max_iterations = 20
  convergence_tol = 1.e-4
```

7.2.52.1.2.2 decay

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)
- [dimension_adaptive](#)
- [decay](#)

Estimate spectral coefficient decay rates to guide dimension-adaptive refinement.

Specification

Alias: none

Argument(s): none

Description

Estimate spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation. These decay rates are used to guide dimension-adaptive refinement, where slower decay rates result in higher dimension preference.

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement decay
  max_iterations = 20
  convergence_tol = 1.e-4
```

7.2.52.1.2.3 generalized

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [p_refinement](#)
- [dimension_adaptive](#)
- [generalized](#)

Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Specification

Alias: none

Argument(s): none

Description

The generalized sparse grid algorithm is a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement generalized
  max_iterations = 20
  convergence_tol = 1.e-4
```

7.2.52.2 max_refinement_iterations

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [max_refinement_iterations](#)

Maximum number of expansion refinement iterations

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

Limits the number of times the expansion can be refined under various refinement strategies.

Examples

```
method,
  polynomial_chaos
  dimension_adaptive generalized
  p_refinement
  max_refinement_iterations = 20
  convergence_tol = 1.e-4
  sparse_grid_level = 1
```

7.2.52.3 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)
- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.52.4 metric_scale

- [Keywords Area](#)
- [method](#)

- [multifidelity_polynomial_chaos](#)
- [metric_scale](#)

define scaling of statistical metrics when adapting UQ surrogates

Specification

Alias: none

Argument(s): none

Default: relative

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group scale of refinement metric (Group 1)	Dakota Keyword relative	Dakota Keyword Description relative scaling of statistical metrics when adapting UQ surrogates
			absolute	use of absolute statistical metrics when adapting UQ surrogates

Description

When adapting a UQ surrogate model, e.g., by change in response covariance matrix or level mappings, this option controls the use of scaling. The `absolute` option indicates that there is no scaling such that the statistical change is compared directly to the convergence tolerance. The `relative` option indicates that the change is measured relative to the current reference value (which evolves during the refinement), such that the convergence tolerance controls the relative change.

Default Behavior

The default is `relative`.

Expected Output

7.2.52.6 allocation_control

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [allocation_control](#)

Sample allocation approach for multifidelity expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multifidelity Sample Allocation Control (Group 1)	greedy	Sample allocation based on greedy refinement within multifidelity polynomial chaos

Description

Multifidelity surrogate approaches, including polynomial chaos, stochastic collocation, and function train, can optionally employ an integrated greedy competition across the model sequence, where each model index can supply one or more refinement candidates which are competed to determine the candidate with the greatest impact on the QoI statistics per unit cost. This greedy competition implicitly determines the optimal sample allocation across model indices.

Default Behavior

The default, when `allocation_control` is not specified, is to compute or adapt separately for each model index (individual instead of integrated refinement).

7.2.52.6.1 [greedy](#)

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [allocation_control](#)
- [greedy](#)

Sample allocation based on greedy refinement within multifidelity polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multifidelity polynomial chaos supports greedy refinement strategies, spanning regression and projection approaches for computing expansion coefficients. The key idea is that each level of the model hierarchy being approximated can generate one or more candidates for refinement. These candidates are competed against each other within a unified competition, and the candidate that induces the largest change in the statistical QoI (response covariance by default, or results of any $z/p/\beta/\beta^*$ level mappings when specified), normalized by relative cost of evaluating the candidate, is selected and then used to generate additional candidates for consideration at its model level.

Examples

The following example of greedy multifidelity regression starts from a zeroth-order reference expansion (a constant) for each level, and generates candidate refinements for each level that are competed in an integrated greedy competition. The number of new samples for the incremented candidate expansion order is determined from the collocation ratio. In this case, the number of candidates for each level is limited to one uniform refinement of the current expansion order.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement uniform
  expansion_order_sequence = 0
  collocation_ratio = .9 seed = 160415
  orthogonal_matching_pursuit
  convergence_tolerance 1.e-2
```

The next example employs generalized sparse grids within a greedy multifidelity competition. Each modeling level starts from a level 0 reference grid (a single point) and generates multiple admissible index set candidates. The full set of candidates across all model levels is competed within an integrated greedy competition, where the greedy selection metric is the induced change in the statistical QoI, normalized by the aggregate simulation cost of the index set candidate. In this case, there are multiple candidates for each model level and the number of candidates grows rapidly with random dimension and grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement dimension_adaptive generalized
  sparse_grid_level_sequence = 0 unrestricted
  convergence_tolerance 1.e-8
```

7.2.52.7 discrepancy_emulation

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Discrepancy Emulation Approach (Group 1)	distinct	Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
    multilevel_polynomial_chaos
    expansion_order_sequence = 2
    collocation_ratio = .9
    orthogonal_matching_pursuit
    discrepancy_emulation recursive
```

7.2.52.7.1 `distinct`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [discrepancy_emulation](#)
- [distinct](#)

Distinct formulation for emulation of model discrepancies.

Specification

Alias: paired

Argument(s): none

Description

The `distinct` approach to discrepancy emulation directly approximate the difference or ratio between the evaluations of two models or solution levels. Refer to the parent documentation node for additional discussion.

Examples

7.2.52.7.2 recursive

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [discrepancy_emulation](#)
- [recursive](#)

Recursive formulation for emulation of model discrepancies.

Specification

7.2.52.9.2 restricted

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [sparse_grid_level_sequence](#)
- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.52.9.3 `unrestricted`

- [Keywords Area](#)
- [method](#)

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	PCE Basis Type (Group 1)	tensor_product	Use a tensor-product index set to construct a polynomial chaos expansion.
			total_order	Use a total-order index set to construct a polynomial chaos expansion.
			adapted	Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion.

Description

Specify the type of basis truncation that determines the terms that are included within a Polynomial Chaos Expansion. Options include tensor-product, total-order, and adapted.

7.2.52.10.2.1 [tensor_product](#)

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [basis_type](#)
- [tensor_product](#)

Use a tensor-product index set to construct a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Description

Use a tensor-product index set to construct a polynomial chaos expansion. That is for a given order p keep all terms with d -dimensional multi index $\mathbf{i} = (i_1, \dots, i_d)$ that satisfies

$$\max(i_1, \dots, i_d) \leq p$$

7.2.52.10.2.2 total_order

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [basis_type](#)
- [total_order](#)

Use a total-order index set to construct a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Description

Use the traditional total-order index set to construct a polynomial chaos expansion. That is for a given order p keep all terms with a d -dimensional multi index $\mathbf{i} = (i_1, \dots, i_d)$ that satisfies

$$\sum_{k=1}^d i_k \leq p$$

7.2.52.10.2.3 adapted

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [basis_type](#)
- [adapted](#)

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		advancements	The maximum number of steps used to expand a basis step.
	Optional		soft_convergence-limit	The maximum number of times no improvement in cross validation error is allowed before the algorithm is terminated.

Description

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion. Basis selection uses compressed sensing to identify a initial set of non zero PCE coefficients. Then these non-zero terms are expanded a set number of times (we suggest 3) and compressed sensing is then applied to these three new index sets. Cross validation is used to choose the best candidate basis. The best basis is then restricted again to the non-zero terms and expanded until no improvement can be gained by adding additional terms.

7.2.52.10.2.4 advancements

- [Keywords Area](#)

- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [basis_type](#)
- [adapted](#)
- [soft_convergence_limit](#)

The maximum number of times no improvement in cross validation error is allowed before the algorithm is terminated.

Specification

Alias: none

Argument(s): INTEGER

Description

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion. Basis selection uses compressed sensing to identify a initial set of non zero PCE coefficients. Then these non-zero terms are expanded a set number of times (we suggest 3) and compressed sensing is then applied to these three new index sets. Cross validation is used to choose the best candidate basis. The best basis is then restricted again to the non-zero terms and expanded until no improvement can be gained by adding additional terms.

7.2.52.10.3 `collocation_ratio`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.

Specification

Alias: none

Argument(s): REAL

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional		collocation_points- _sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional (Choose One)	Regression Algorithm (Group 1)	least_squares	Compute the coefficients of a polynomial expansion using least squares
			orthogonal_ matching_pursuit	Compute the coefficients of a polynomial expansion using orthogonal matching pursuit (OMP)
			basis_pursuit	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit ℓ_1 -minimization problem using linear programming.
			basis_pursuit_ denoising	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit Denoising ℓ_1 -minimization problem using second order cone optimization.
			least_angle_ regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
			least_absolute_ shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.

	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.
	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional	max_solver_ - iterations	Maximum iterations in determining polynomial coefficients

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

7.2.52.10.3.1 collocation_points_sequence

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: pilot_samples

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

- [least_absolute_shrinkage](#)
- [noise_tolerance](#)

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

Specification

Alias: none

Argument(s): REALLIST

Default: 1e-3 for BPDN, 0. otherwise (algorithms run until termination)

Description

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

7.2.52.10.3.14 l_2 _penalty

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.52.10.3.15 cross_validation

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.52.10.3.16 noise_only

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.52.10.3.17 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

These keywords may also be of interest:

- [increment_max_order](#)
- [increment_max_rank_order](#)
- [polynomial_chaos](#)

- [multifidelity_polynomial_chaos](#)
- [function_train](#)
- [multifidelity_function_train](#)

7.2.52.10.3.18 ratio_order

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces samples = 2N). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.52.10.3.19 response_scaling

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to [0,1] based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

7.2.52.10.3.20 `use_derivatives`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.52.10.3.21 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)

- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.52.10.3.22 reuse_points

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [expansion_samples_sequence](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.52.10.5 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.52.10.5.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1             0.9          1.1          0.0002          0.26          0.76

- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID           0.9         1.1         0.0002          0.26          0.76

- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.52.10.5.7 active_only

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.52.11 orthogonal_least_interpolation

- [Keywords Area](#)
- [method](#)

- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: least_interpolation oli

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points_sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

7.2.52.11.1 `collocation_points_sequence`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

See Also

These keywords may also be of interest:

- [collocation_points](#)

7.2.52.11.2 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.52.11.3 `reuse_points`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)

- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.52.11.4 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.52.11.4.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>header</code>	Enable header row in custom-annotated tabular file
	Optional		<code>eval_id</code>	Enable evaluation ID column in custom-annotated tabular file
	Optional		<code>interface_id</code>	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76

7.2.52.11.4.7 active_only

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.52.12 `askey`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

See Also

These keywords may also be of interest:

7.2.52.13 wiener

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

See Also

These keywords may also be of interest:

- [polynomial_chaos](#)
- [askey](#)

7.2.52.14 normalized

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [normalized](#)

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

Specification

Alias: none

Argument(s): none

Default: PCE coefficients correspond to unnormalized basis polynomials

Description

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

7.2.52.15 export_expansion_file

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [export_expansion_file](#)

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file

Specification

Alias: none

Argument(s): STRING

Description

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file. The multi-index written will be sparse. Specifically the expansion will consist only of the indices corresponding to the non-zero coefficients of the PCE.

7.2.52.16 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: samples

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
  quadrature_order = 2
  samples_on_emulator = 10000
```

7.2.52.17 sample_type

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Sample Type (Group 1)	Dakota Keyword lhs	Dakota Keyword Description Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.52.17.1 lhs

- [multifidelity_polynomial_chaos](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.52.17.2 random

- [Keywords Area](#)
- [method](#)

- [multifidelity_polynomial_chaos](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.52.18 rng

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.52.18.1 `mt19937`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.52.18.2 rnum2

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.52.19 `probability_refinement`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_refinement](#)

Allow refinement of probability and generalized reliability results using importance sampling

Topics

This keyword is related to the topics:

- [reliability_methods](#)

Specification

Alias: `sample_refinement`

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group Importance Sampling Approach (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		import	Importance sampling option for probability refinement
			adapt_import	Importance sampling option for probability refinement
			mm_adapt_import	Importance sampling option for probability refinement
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.

Description

The `probability_refinement` allows refinement of probability and generalized reliability results using importance sampling. If one specifies `probability_refinement`, there are some additional options. One can specify which type of importance sampling to use (`import`, `adapt_import`, or `mm_adapt_import`). Additionally, one can specify the number of refinement samples to use with `refinement_samples` and the seed to use with `seed`.

The `probability_refinement` density reweighting accounts originally was developed based on Gaussian distributions. It now accounts for additional non-Gaussian cases.

7.2.52.19.1 import

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_refinement](#)
- [import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level).

7.2.52.19.2 adapt_import

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_refinement](#)
- [adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`adapt_import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). This continues iteratively until the failure probability estimate converges.

7.2.52.19.3 mm_adapt_import

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_refinement](#)
- [mm_adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

7.2.52.19.4 refinement_samples

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_refinement](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the `initial_samples` in a sampling design.

7.2.52.20 `final_moments`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Output standardized moments and include them within the set of final statistics.
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
```

```

samples = 50 seed = 1234
response_levels = 3.6e+11 1.2e+05 3.5e+05
final_moments central

```

Overriding the default to `none` as follows:

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

allows associated nested model mappings to be simplified from:

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.

```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.

```

7.2.52.20.1 none

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

7.2.52.20.2 standard

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

7.2.52.20.3 central

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.52.21 response_levels

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds    = 199.3, 474.63
  upper_bounds    = 298.5, 712.
  descriptors     = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas          = 12., 30.
  betas           = 250., 590.
  descriptors     = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs      = 3 4
  abscissas      = 5 8 10 .1 .2 .3 .4
  counts         = 17 21 0 12 24 12 0
  descriptors    = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs    = 2
  abscissas    = 3 4
  counts       = 1 1
  descriptors  = 'TF3h'
```

```

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians

```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Bin Lower	Bin Upper	Density Value

6.5000000000e+04	2.9000000000e-01		
7.0000000000e+04	9.0000000000e-02		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
3.5000000000e+05	5.2000000000e-01		
4.0000000000e+05	9.0000000000e-02		
4.5000000000e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.52.21.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.52.21.2 compute

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels
			reliabilities	Computes reliabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
```

```

                                3.5e+05 4.0e+05 4.5e+05
compute reliabilities

```

7.2.52.21.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```

method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities

```

7.2.52.21.2.2 reliabilities

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)

- [compute](#)
- [reliabilities](#)

Computes reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `reliabilities` keyword directs Dakota to compute reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the reliabilities are not computed by default. To change this behavior, the `reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.52.21.2.3 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
                     3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.52.21.2.4 system

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system

			parallel	Aggregate response statistics assuming a parallel system
--	--	--	--------------------------	--

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.52.22 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```

method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds     = 199.3, 474.63
  upper_bounds     = 298.5, 712.
  descriptors       = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas           = 12., 30.

```

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.52.25 distribution

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Distribution Type (CDF/CCDF) (Group 1)	cumulative	Computes statistics according to cumulative functions

			complementary	Computes statistics according to complementary cumulative functions
--	--	--	-------------------------------	---

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.52.25.1 cumulative

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.52.25.2 complementary

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.52.26 variance_based_decomp

- [Keywords Area](#)

- [method](#)
- [multifidelity_polynomial_chaos](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		interaction_order	Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.
	Optional		drop_tolerance	Suppresses output of sensitivity indices with values lower than this tolerance

Description

Dakota can calculate sensitivity indices through variance-based decomposition using the keyword `variance_based_decomp`. This approach decomposes main, interaction, and total effects in order to identify the most important variables and combinations of variables in contributing to the variance of output quantities of interest.

Default Behavior

Because of processing overhead and output volume, `variance_based_decomp` is inactive by default, unless required for dimension-adaptive refinement using Sobol' indices.

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects, total effects, and any interaction effects will be reported. Each of these effects represents the percent contribution to the variance in the model response, where main effects include the aggregated set of *univariate* terms for each individual variable, interaction effects represent the set of *mixed* terms (the complement of the univariate set), and total effects represent the *complete* set of terms (univariate and mixed) that contain each individual variable. The aggregated set of main and interaction sensitivity indices will sum to one, whereas the sum of total effects sensitivity indices will be greater than one due to redundant counting of mixed terms.

Usage Tips

An important consideration is that the number of possible interaction terms grows exponentially with dimension and expansion order. To mitigate this, both in terms of compute time and output volume, possible interaction effects are suppressed whenever no contributions are present due to the particular form of an expansion. In addition, the `interaction_order` and `drop_tolerance` controls can further limit the computational and output requirements.

Examples

```
method,
  polynomial_chaos # or stoch_collocation
  sparse_grid_level = 3
  variance_based_decomp interaction_order = 2
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76]: "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [90].

7.2.52.26.1 interaction_order

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [variance_based_decomp](#)
- [interaction_order](#)

Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

Specification

Alias: none

Argument(s): INTEGER

Default: Unrestricted (VBD includes all interaction orders present in the expansion)

Description

The `interaction_order` option has been added to allow suppression of higher-order interactions, since the output volume (and memory and compute consumption) of these results could be extensive for high dimensional problems (note: the previous `univariate_effects` specification is equivalent to `interaction_order = 1` in the current specification). Similar to suppression of interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to again save compute and memory resources and reduce output volume)

7.2.52.26.2 drop_tolerance

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,
  sampling
    sample_type lhs
    samples = 100
    variance_based_decomp
    drop_tolerance = 0.001
```

7.2.52.27 diagonal_covariance

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: `diagonal_covariance` for response vector > 10; else `full_covariance`

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.52.28 full_covariance

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.52.29 import_approx_points_file

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [import_approx_points_file](#)

Filename for points at which to evaluate the PCE/SC surrogate

Specification

Alias: none

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

Default Behavior No import of points at which to evaluate the surrogate.

Expected Output The PCE/SC surrogate model will be evaluated at the list of points (input variable values) provided in the file and results tabulated and/or statistics computed at them, depending on the method context.

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_approx_points_file = 'import.mcmc_annot.dat'
    annotated
```

7.2.52.29.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [import_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
--	-------------------	----------------------	----------------	----------------------------

	Optional	header	Enable header row in custom-annotated tabular file
	Optional	eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional	interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1         0.0002  0.26            0.76
2              0.90009    1.1 0.0001996404857  0.2601620081  0.759955

- [interface_id](#)

Enable interface ID column in custom-annotated tabular file

Specification

Alias: none

Argument(s): none

Default: no `interface_id` column

Description

See description of parent `custom_annotated`

7.2.52.29.2 `annotated`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [import_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.52.29.3 freeform

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [import_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.52.29.4 active_only

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [import_approx_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.52.30 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional Optional (<i>Choose One</i>)	Description of Group Tabular Format (Group 1)	Dakota Keyword custom_annotated	Dakota Keyword Description Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.52.30.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: `annotated` format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76

7.2.52.31 seed_sequence

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For L levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 100 50 40 30 20
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.52.32 `fixed_seed`

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.52.33 model_pointer

- [Keywords Area](#)
- [method](#)
- [multifidelity_polynomial_chaos](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```

environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'

	Optional		allocation_control	Sample allocation approach for multilevel expansions
	Optional		convergence_tolerance	Stopping criterion based on objective function or statistics convergence
	Optional		metric_scale	define scaling of statistical metrics when adapting UQ surrogates
	Optional		discrepancy_emulation	Formulation for emulation of model discrepancies.
	Required (Choose One)	Coefficient Computation Approach (Group 1)	expansion_order_sequence	Sequence of expansion orders used in a multi-stage expansion
			orthogonal_least_interpolation	Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.
	Optional (Choose One)	Basis Polynomial Family (Group 2)	askey	Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.
			wiener	Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

	Optional	normalized	The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials
	Optional	export_expansion_file	Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file
	Optional	samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional	sample_type	Selection of sampling strategy
	Optional	rng	Selection of a random number generator
	Optional	probability_refinement	Allow refinement of probability and generalized reliability results using importance sampling
	Optional	final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value

	Optional		reliability_levels	Specify reliability levels at which the response values will be estimated
	Optional		gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional		distribution	Selection of cumulative or complementary cumulative functions
	Optional		variance_based_decomp	Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects
	Optional (<i>Choose One</i>)	Covariance Type (Group 3)	diagonal_covariance	Display only the diagonal terms of the covariance matrix
			full_covariance	Display the full covariance matrix
	Optional		import_approx_points_file	Filename for points at which to evaluate the PCE/SC surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets

	Optional	<code>model_pointer</code>	Identifier for model block to be used by a method
--	-----------------	----------------------------	---

Description

As described in [polynomial_chaos](#), the polynomial chaos expansion (PCE) is a general framework for the approximate representation of random response functions in terms of series expansions in standardized random variables:

$$R = \sum_{i=0}^P \alpha_i \Psi_i(\xi)$$

where α_i is a deterministic coefficient, Ψ_i is a multidimensional orthogonal polynomial and ξ is a vector of standardized random variables.

In the multilevel and multifidelity cases, we decompose this expansion into several constituent expansions, one per model form or solution control level. In a bi-fidelity case with low-fidelity (LF) and high-fidelity (HF) models, we have:

$$R = \sum_{i=0}^{p^{LF}} \alpha_i^{LF} \Psi_i(\xi) + \sum_{i=0}^{p^{HF}} \delta_i \Psi_i(\xi)$$

where δ_i is a coefficient for the discrepancy expansion.

For the case of regression-based PCE (least squares, compressed sensing, or orthogonal least interpolation), an optimal sample allocation procedure can be applied for the resolution of each level within a multilevel sampling procedure as in [multilevel_sampling](#). The core difference is that a Monte Carlo estimator of the statistics is replaced with a PCE-based estimator of the statistics, requiring approximation of the variance of these estimators.

Initial prototypes for multilevel PCE can be explored using `dakota/share/dakota/test/dakota_uq_diffusion_mlpce.in`, and will be stabilized in future releases.

Additional Resources

Dakota provides access to multilevel PCE methods through the `NonDMultilevelPolynomialChaos` class. Refer to the Stochastic Expansion Methods chapter of the Theory Manual [16] for additional information on the Multilevel PCE algorithm.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Integration and Expansion Moments](#) (expansion moments only)
- [Probability Density](#)
- [Level Mappings](#)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Examples

```
method,
  multilevel_polynomial_chaos
  model_pointer = 'HIERARCH'
  pilot_samples = 10
  expansion_order_sequence = 2
  collocation_ratio = .9
  seed = 1237
```

```
    orthogonal_matching_pursuit
    convergence_tolerance = .01
    output silent

model,
  id_model = 'HIERARCH'
  surrogate hierarchical
  ordered_model_fidelities = 'SIM1'
  correction additive zeroth_order

model,
  id_model = 'SIM1'
  simulation
  solution_level_control = 'mesh_size'
  solution_level_cost = 1. 8. 64. 512. 4096.
```

- [multilevel_polynomial_chaos](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: fsu_cvt , local_reliability: 25; global_{reliability , interval_est , evidence} / efficient_global: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multilevel Sample Allocation Control (Group 1)	estimator_variance	Variance of mean estimator within multilevel polynomial chaos
			rip_sampling	Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Description

Multilevel expansions, including regression-based polynomial chaos expansion (PCE) and function train (FT) expansions, require a sample allocation strategy. Three options are currently available:

- allocation based on assuming a convergence rate for the estimator variance (for regression PCE)

- restricted isometry property (RIP) sampling (for regression PCE via compressed sensing)
- rank sampling (for FT)

Default Behavior

Current defaults, when `allocation_control` is not specified, are estimator variance for PCE and rank sampling for FT.

7.2.53.2.1 estimator_variance

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [allocation_control](#)
- [estimator_variance](#)

Variance of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Child Keywords:

Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
Optional		estimator_rate	Rate of convergence of mean estimator within multilevel polynomial chaos

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ , with default values that may be overridden as part of this specification block.

This approach is supported for regression-based PCE approaches (over-determined least squares, under-determined compressed sensing, or orthogonal least interpolation).

In practice, it can be challenging to estimate a smooth convergence rate for estimator variance in the presence of abrupt transitions in the quality of sparse recoveries. As a result, sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the convergence of the estimator variance, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```
method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
    orthogonal_matching_pursuit
    expansion_order_sequence = 2
    pilot_samples = 10
    collocation_ratio = .9
    allocation_control
      estimator_variance estimator_rate = 2.5
    seed = 1237
    convergence_tolerance = .01
```

7.2.53.2.1.1 estimator_rate

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [allocation_control](#)
- [estimator_variance](#)
- [estimator_rate](#)

Rate of convergence of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): REAL

Default: 2

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ .

The default values are $\gamma = 1$ and $\kappa = 2$ (adopts a more aggressive sample profile by assuming a faster convergence rate than Monte Carlo). This advanced specification option allows to user to specify κ , overriding the default.

7.2.53.2.2 rip_sampling

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [allocation_control](#)
- [rip_sampling](#)

Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multilevel polynomial chaos with compressed sensing may allocate the number of samples per level based on the restricted isometry property (RIP), applied to recovery at level l :

$$N_l \geq s_l \log^3(s_l) L_l \log(C_l)$$

for sparsity s , cardinality C , and mutual coherence L . The adaptive algorithm starts from a pilot sample, shapes the profile based on observed sparsity, and iterates until convergence. In practice, RIP sampling levels are quite conservative, and a collocation ratio constraint ($N_l \leq rC_l$, where r defaults to 2) must be enforced on the profile.

The algorithm relies on observed sparsity, it is appropriate for use with regularized solvers for compressed sensing. It employs orthogonal matching pursuit (OMP) by default and automatically activates cross-validation in order to choose the best noise parameter value for the recovery.

This capability is **experimental**. Sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the number of sparse coefficient sets recovered for each level, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```
method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
  orthogonal_matching_pursuit
  expansion_order_sequence = 2
  pilot_samples = 10
  collocation_ratio = .9
  allocation_control rip_sampling
  seed = 1237
  convergence_tolerance = .01
```

7.2.53.3 convergence_tolerance

- [Keywords Area](#)
- [method](#)

- [multilevel_polynomial_chaos](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)
- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.53.4 `metric_scale`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [metric_scale](#)

define scaling of statistical metrics when adapting UQ surrogates

Specification

Alias: none

Argument(s): none

Default: relative

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group scale of refinement metric (Group 1)	Dakota Keyword relative	Dakota Keyword Description relative scaling of statistical metrics when adapting UQ surrogates
			absolute	use of absolute statistical metrics when adapting UQ surrogates

Description

When adapting a UQ surrogate model, e.g., by change in response covariance matrix or level mappings, this option controls the use of scaling. The `absolute` option indicates that there is no scaling such that the statistical change is compared directly to the convergence tolerance. The `relative` option indicates that the change is measured relative to the current reference value (which evolves during the refinement), such that the convergence tolerance controls the relative change.

Default Behavior

The default is `relative`.

7.2.53.5 `discrepancy_emulation`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Discrepancy Emulation Approach (Group 1)	Dakota Keyword distinct	Dakota Keyword Description Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
  multilevel_polynomial_chaos
  expansion_order_sequence = 2
  collocation_ratio = .9
  orthogonal_matching_pursuit
  discrepancy_emulation recursive
```

7.2.53.6.3 `collocation_ratio`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.

Specification

Alias: none

Argument(s): REAL

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional		collocation_points- _sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional (Choose One)	Regression Algorithm (Group 1)	least_squares	Compute the coefficients of a polynomial expansion using least squares
			orthogonal_ matching_pursuit	Compute the coefficients of a polynomial expansion using orthogonal matching pursuit (OMP)
			basis_pursuit	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit ℓ_1 -minimization problem using linear programming.
			basis_pursuit_ denoising	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit Denoising ℓ_1 -minimization problem using second order cone optimization.
			least_angle_ regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
			least_absolute_ shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.

	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.
	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional	max_solver_ iterations	Maximum iterations in determining polynomial coefficients

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

7.2.53.6.3.1 collocation_points_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_tolerance	The noise tolerance used when performing cross validation in the presence of noise or truncation errors.
	Optional		l2_penalty	The l_2 penalty used when performing compressed sensing with elastic net.

Description

Compute the coefficients of a polynomial expansion by using the LASSO problem.

7.2.53.6.3.13 noise_tolerance

- [Keywords Area](#)
- [method](#)

- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [noise_tolerance](#)

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

Specification

Alias: none

Argument(s): REALLIST

Default: 1e-3 for BPDN, 0. otherwise (algorithms run until termination)

Description

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

7.2.53.6.3.14 l_2 _penalty

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.53.6.3.15 cross_validation

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.53.6.3.16 noise_only

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.53.6.3.17 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

See Also

These keywords may also be of interest:

- [increment_max_order](#)
- [increment_max_rank_order](#)
- [polynomial_chaos](#)

- [multifidelity_polynomial_chaos](#)
- [function_train](#)
- [multifidelity_function_train](#)

7.2.53.6.3.18 ratio_order

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces $\text{samples} = 2N$). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.53.6.3.19 response_scaling

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to [0,1] based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

These keywords may also be of interest:

- [multifidelity_polynomial_chaos](#)
- [multifidelity_function_train](#)

7.2.53.6.3.20 use_derivatives

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.53.6.3.21 tensor_grid

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)

- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.53.6.3.22 reuse_points

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.53.6.3.23 max_solver_iterations

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)

- [collocation_ratio](#)
- [max_solver_iterations](#)

Maximum iterations in determining polynomial coefficients

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

When using an iterative polynomial coefficient estimation approach, e.g., cross-validation-based solvers, limits the maximum iterations in the coefficient solver.

7.2.53.6.4 [expansion_samples_sequence](#)

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [expansion_samples_sequence](#)

Sequence of expansion samples used in a multi-stage polynomial chaos expansion

Each level entry of the `expansion_samples_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support expansion samples sequences include multilevel and multifidelity polynomial chaos.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [expansion_samples](#)

Specification

Alias: none

Argument(s): INTEGERLIST

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

See Also

These keywords may also be of interest:

- [expansion_samples](#)

7.2.53.6.4.1 reuse_points

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [expansion_samples_sequence](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.53.6.5 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.53.6.5.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1      x2      obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9      1.1      0.0002      0.26      0.76
2             0.90009  1.1 0.0001996404857  0.2601620081  0.759955
3             0.89991  1.1 0.0002003604863  0.2598380081  0.760045
...
```

Default: no interface_id column

Description

See description of parent `custom_annotated`

7.2.53.6.5.5 annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.53.6.5.6 freeform

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.53.6.5.7 active_only

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.53.7 orthogonal_least_interpolation

- [Keywords Area](#)
- [method](#)

- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: least_interpolation oli

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points_sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

7.2.53.7.1 collocation_points_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.53.7.3 `reuse_points`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)

- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.53.7.4 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.53.7.4.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>header</code>	Enable header row in custom-annotated tabular file
	Optional		<code>eval_id</code>	Enable evaluation ID column in custom-annotated tabular file
	Optional		<code>interface_id</code>	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76
2              0.90009      1.1 0.0001996404857  0.2601620081    0.759955
3              0.89991      1.1 0.0002003604863  0.2598380081    0.760045
...
```

7.2.53.7.4.5 annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.53.7.4.6 freeform

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009      1.1 0.0001996404857  0.2601620081  0.759955
0.89991      1.1 0.0002003604863  0.2598380081  0.760045
...

```

7.2.53.7.4.7 active_only

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.53.8 askey

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

See Also

These keywords may also be of interest:

- [polynomial_chaos](#)
- [wiener](#)

7.2.53.9 wiener

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

See Also

These keywords may also be of interest:

- [polynomial_chaos](#)
- [askey](#)

7.2.53.10 normalized

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [normalized](#)

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

Specification

Alias: none

Argument(s): none

Default: PCE coefficients correspond to unnormalized basis polynomials

Description

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

7.2.53.11 export_expansion_file

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [export_expansion_file](#)

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file

Specification

Alias: none

Argument(s): STRING

Description

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file. The multi-index written will be sparse. Specifically the expansion will consist only of the indices corresponding to the non-zero coefficients of the PCE.

7.2.53.12 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: samples

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.53.13 sample_type

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Sample Type (Group 1)	Dakota Keyword lhs	Dakota Keyword Description Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.53.13.1 lhs

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.53.13.2 random

- [Keywords Area](#)
- [method](#)

- [multilevel_polynomial_chaos](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.53.14 rng

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.53.14.1 mt19937

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.53.14.2 `rnum2`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.53.15 probability_refinement

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_refinement](#)

Allow refinement of probability and generalized reliability results using importance sampling

Topics

This keyword is related to the topics:

- [reliability_methods](#)

Specification

Alias: sample_refinement

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group Importance Sampling Approach (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		import	Importance sampling option for probability refinement
			adapt_import	Importance sampling option for probability refinement
			mm_adapt_import	Importance sampling option for probability refinement
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.

Description

The `probability_refinement` allows refinement of probability and generalized reliability results using importance sampling. If one specifies `probability_refinement`, there are some additional options. One can specify which type of importance sampling to use (`import`, `adapt_import`, or `mm_adapt_import`). Additionally, one can specify the number of refinement samples to use with `refinement_samples` and the seed to use with `seed`.

The `probability_refinement` density reweighting accounts originally was developed based on Gaussian distributions. It now accounts for additional non-Gaussian cases.

7.2.53.15.1 import

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_refinement](#)
- [import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level).

7.2.53.15.2 adapt_import

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_refinement](#)
- [adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`adapt_import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). This continues iteratively until the failure probability estimate converges.

7.2.53.15.3 mm_adapt_import

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_refinement](#)
- [mm_adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

7.2.53.15.4 refinement_samples

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_refinement](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the `initial_samples` in a sampling design.

7.2.53.16 `final_moments`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Output standardized moments and include them within the set of final statistics.
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
```

```

samples = 50 seed = 1234
response_levels = 3.6e+11 1.2e+05 3.5e+05
final_moments central

```

Overriding the default to `none` as follows:

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

allows associated nested model mappings to be simplified from:

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.

```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.

```

7.2.53.16.1 none

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

7.2.53.16.2 standard

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

7.2.53.16.3 central

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.53.17 response_levels

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors       = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas            = 12., 30.
  betas             = 250., 590.
  descriptors       = 'TF1w' 'TF2w'

  counts            = 1 1
  descriptors       = 'TF3h'
```

```

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians

```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
3.5000000000e+05	5.2000000000e-01		
4.0000000000e+05	9.0000000000e-02		
4.5000000000e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.53.17.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.53.17.2 compute

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels
			reliabilities	Computes reliabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
```

```

                                3.5e+05 4.0e+05 4.5e+05
compute reliabilities

```

7.2.53.17.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```

method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities

```

7.2.53.17.2.2 reliabilities

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)

- [compute](#)
- [reliabilities](#)

Computes reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `reliabilities` keyword directs Dakota to compute reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the reliabilities are not computed by default. To change this behavior, the `reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.53.17.2.3 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.53.17.2.4 system

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.53.17.2.5 series

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [series](#)

Aggregate response statistics assuming a series system

Specification

Alias: none

Argument(s): none

Description

See parent keyword `system` for description.

7.2.53.17.2.6 parallel

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [parallel](#)

Aggregate response statistics assuming a parallel system

Specification

Alias: none

Argument(s): none

Description

See parent keyword `system` for description.

7.2.53.18 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.
```

```

variables,
  normal_uncertain = 2
    means          = 248.89, 593.33
    std_deviations = 12.4, 29.7
    descriptors    = 'TF1n' 'TF2n'
  uniform_uncertain = 2
    lower_bounds   = 199.3, 474.63
    upper_bounds   = 298.5, 712.
    descriptors    = 'TF1u' 'TF2u'
  weibull_uncertain = 2
    alphas         = 12., 30.
    betas          = 250., 590.
    descriptors    = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
    num_pairs      = 3 4
    abscissas     = 5 8 10 .1 .2 .3 .4

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Distribution Type (CDF/CCDF) (Group 1)	cumulative	Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.53.21.1 cumulative

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.53.21.2 complementary

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)

- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.53.22 variance_based_decomp

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		interaction_order	Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.
	Optional		drop_tolerance	Suppresses output of sensitivity indices with values lower than this tolerance

Description

Dakota can calculate sensitivity indices through variance-based decomposition using the keyword `variance_based_decomp`. This approach decomposes main, interaction, and total effects in order to identify the most important variables and combinations of variables in contributing to the variance of output quantities of interest.

Default Behavior

Because of processing overhead and output volume, `variance_based_decomp` is inactive by default, unless required for dimension-adaptive refinement using Sobol' indices.

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects, total effects, and any interaction effects will be reported. Each of these effects represents the percent contribution to the variance in the model response, where main effects include the aggregated set of *univariate* terms for each individual variable, interaction effects represent the set of *mixed* terms (the complement of the univariate set), and total effects represent the *complete* set of terms (univariate and mixed) that contain each individual variable. The aggregated set of main and interaction sensitivity indices will sum to one, whereas the sum of total effects sensitivity indices will be greater than one due to redundant counting of mixed terms.

Usage Tips

An important consideration is that the number of possible interaction terms grows exponentially with dimension and expansion order. To mitigate this, both in terms of compute time and output volume, possible interaction effects are suppressed whenever no contributions are present due to the particular form of an expansion. In addition, the `interaction_order` and `drop_tolerance` controls can further limit the computational and output requirements.

Examples

```
method,
  polynomial_chaos # or stoch_collocation
  sparse_grid_level = 3
  variance_based_decomp interaction_order = 2
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76]: "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the

input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [90].

7.2.53.22.1 interaction_order

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [variance_based_decomp](#)
- [interaction_order](#)

Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

Specification

Alias: none

Argument(s): INTEGER

Default: Unrestricted (VBD includes all interaction orders present in the expansion)

Description

The `interaction_order` option has been added to allow suppression of higher-order interactions, since the output volume (and memory and compute consumption) of these results could be extensive for high dimensional problems (note: the previous `univariate_effects` specification is equivalent to `interaction_order = 1` in the current specification). Similar to suppression of interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to again save compute and memory resources and reduce output volume)

7.2.53.22.2 drop_tolerance

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,
  sampling
    sample_type lhs
    samples = 100
    variance_based_decomp
    drop_tolerance = 0.001
```

7.2.53.23 `diagonal_covariance`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: `diagonal_covariance` for response vector > 10; else `full_covariance`

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.53.24 `full_covariance`

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)

- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.53.25 import_approx_points_file

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [import_approx_points_file](#)

Filename for points at which to evaluate the PCE/SC surrogate

Specification

Alias: none

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

Default Behavior No import of points at which to evaluate the surrogate.

Expected Output The PCE/SC surrogate model will be evaluated at the list of points (input variable values) provided in the file and results tabulated and/or statistics computed at them, depending on the method context.

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_approx_points_file = 'import.mcmc_annot.dat'
    annotated
```

7.2.53.25.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [import_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether header row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) annotated.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76
2              0.90009      1.1 0.0001996404857  0.2601620081      0.759955
3              0.89991      1.1 0.0002003604863  0.2598380081      0.760045
...
```

7.2.53.25.2 annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [import_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.53.25.3 freeform

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [import_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009        1.1 0.0001996404857  0.2601620081  0.759955
0.89991        1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.53.25.4 active_only

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [import_approx_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.53.26 export_approx_points_file

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: export_points_file

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.53.26.1 custom_annotated

7.2.53.27 seed_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For $\$L\$$ levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 100 50 40 30 20
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

7.2.53.28 `fixed_seed`

- [Keywords Area](#)

- [method](#)
- [multilevel_polynomial_chaos](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.53.29 model_pointer

- [Keywords Area](#)
- [method](#)
- [multilevel_polynomial_chaos](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which `model` block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a `model` block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```

	Optional		convergence_ - tolerance	Stopping criterion based on objective function or statistics convergence
	Optional		metric_scale	define scaling of statistical metrics when adapting UQ surrogates
	Required (<i>Choose One</i>)	Interpolation Grid Type (Group 2)	quadrature_order	Order for tensor-products of Gaussian quadrature rules

			sparse_grid_level	Level to use in sparse grid integration or interpolation
	Optional (<i>Choose One</i>)	Basis Polynomial Family (Group 3)	piecewise	Use piecewise local basis functions
			askey	Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.
			wiener	Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional		sample_type	Selection of sampling strategy
	Optional		rng	Selection of a random number generator
	Optional		probability_refinement	Allow refinement of probability and generalized reliability results using importance sampling

	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional		response_levels	Values at which to estimate desired statistics for each response
	Optional		probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional		reliability_levels	Specify reliability levels at which the response values will be estimated
	Optional		gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional		distribution	Selection of cumulative or complementary cumulative functions
	Optional		variance_based_decomp	Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects
	Optional (<i>Choose One</i>)	Covariance Type (Group 4)	diagonal_covariance	Display only the diagonal terms of the covariance matrix
			full_covariance	Display the full covariance matrix
	Optional		import_approx_points_file	Filename for points at which to evaluate the PCE/SC surrogate

	Optional	export_approx_points_file	Output file for surrogate model value evaluations
	Optional	seed	Seed of the random number generator
	Optional	fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional	model_pointer	Identifier for model block to be used by a method

Description

Stochastic collocation is a general framework for approximate representation of random response functions in terms of finite-dimensional interpolation bases.

The stochastic collocation (SC) method is very similar to [polynomial_chaos](#), with the key difference that the orthogonal polynomial basis functions are replaced with interpolation polynomial bases. The interpolation polynomials may be either local or global and either value-based or gradient-enhanced. In the local case, valued-based are piecewise linear splines and gradient-enhanced are piecewise cubic splines, and in the global case, valued-based are Lagrange interpolants and gradient-enhanced are Hermite interpolants. A value-based expansion takes the form

$$R = \sum_{i=1}^{N_p} r_i L_i(\xi)$$

where N_p is the total number of collocation points, r_i is a response value at the i^{th} collocation point, L_i is the i^{th} multidimensional interpolation polynomial, and ξ is a vector of standardized random variables.

Thus, in PCE, one forms coefficients for known orthogonal polynomial basis functions, whereas SC forms multidimensional interpolation functions for known coefficients.

Basis polynomial family (Group 2)

In addition to the [askey](#) and [wiener](#) basis types also supported by [polynomial_chaos](#), SC supports the option of `piecewise` local basis functions. These are piecewise linear splines, or in the case of gradient-enhanced interpolation via the `use_derivatives` specification, piecewise cubic Hermite splines. Both of these basis options provide local support only over the range from the interpolated point to its nearest 1D neighbors (within a tensor grid or within each of the tensor grids underlying a sparse grid), which exchanges the fast convergence of global bases for smooth functions for robustness in the representation of nonsmooth response functions (that can induce Gibbs oscillations when using high-order global basis functions). When local basis functions are used, the usage of nonequidistant collocation points (e.g., the Gauss point selections described above) is not well motivated, so equidistant Newton-Cotes points are employed in this case, and all random variable types are transformed to standard uniform probability space. The global gradient-enhanced interpolants (Hermite interpolation polynomials) are also restricted to uniform or transformed uniform random variables (due to the need to compute collocation weights by integration of the basis polynomials) and share the variable support shown in [variable_support](#) for Piecewise SE. Due to numerical instability in these high-order basis polynomials, they are deactivated by default but can be activated by developers using a compile-time switch.

Interpolation grid type (Group 3)

To form the multidimensional interpolants L_i of the expansion, two options are provided.

1. interpolation on a tensor-product of Gaussian quadrature points (specified with `quadrature_order` and,

optionally, `dimension_preference` for anisotropic tensor grids). As for PCE, non-nested Gauss rules are employed by default, although the presence of `p_refinement` or `h_refinement` will result in default usage of nested rules for normal or uniform variables after any variable transformations have been applied (both defaults can be overridden using explicit `nested` or `non_nested` specifications).

- interpolation on a Smolyak sparse grid (specified with `sparse_grid_level` and, optionally, `dimension_preference` for anisotropic sparse grids) defined from Gaussian rules. As for sparse PCE, nested rules are employed unless overridden with the `non_nested` option, and the growth rules are restricted unless overridden by the `unrestricted` keyword.

Another distinguishing characteristic of stochastic collocation relative to [polynomial_chaos](#) is the ability to reformulate the interpolation problem from a `nodal` interpolation approach into a `hierarchical` formulation in which each new level of interpolation defines a set of incremental refinements (known as hierarchical surpluses) layered on top of the interpolants from previous levels. This formulation lends itself naturally to uniform or adaptive refinement strategies, since the hierarchical surpluses can be interpreted as error estimates for the interpolant. Either global or local/piecewise interpolants in either value-based or gradient-enhanced approaches can be formulated using `hierarchical` interpolation. The primary restriction for the hierarchical case is that it currently requires a sparse grid approach using nested quadrature rules (Genz-Keister, Gauss-Patterson, or Newton-Cotes for standard normals and standard uniforms in a transformed space: Askey, Wiener, or Piecewise settings may be required), although this restriction can be relaxed in the future. A selection of `hierarchical` interpolation will provide greater precision in the increments to mean, standard deviation, covariance, and reliability-based level mappings induced by a grid change within uniform or goal-oriented adaptive refinement approaches (see following section).

It is important to note that, while `quadrature_order` and `sparse_grid_level` are array inputs, only one scalar from these arrays is active at a time for a particular expansion estimation. These scalars can be augmented with a `dimension_preference` to support anisotropy across the random dimension set. The array inputs are present to support advanced use cases such as multifidelity UQ, where multiple grid resolutions can be employed.

Automated refinement type (Group 1)

Automated expansion refinement can be selected as either `p_refinement` or `h_refinement`, and either refinement specification can be either `uniform` or `dimension_adaptive`. The `dimension_adaptive` case can be further specified as either `sobol` or `generalized` (decay not supported). Each of these automated refinement approaches makes use of the `max_iterations` and `convergence_tolerance` iteration controls. The `h_refinement` specification involves use of the same piecewise interpolants (linear or cubic Hermite splines) described above for the `piecewise` specification option (it is not necessary to redundantly specify `piecewise` in the case of `h_refinement`). In future releases, the `hierarchical` interpolation approach will enable local refinement in addition to the current `uniform` and `dimension_adaptive` options.

Covariance type (Group 5)

These two keywords are used to specify how this method computes, stores, and outputs the covariance of the responses. In particular, the diagonal covariance option is provided for reducing post-processing overhead and output volume in high dimensional applications.

Active Variables

The default behavior is to form expansions over aleatory uncertain continuous variables. To form expansions over a broader set of variables, one needs to specify `active` followed by `state`, `epistemic`, `design`, or `all` in the variables specification block.

For continuous design, continuous state, and continuous epistemic uncertain variables included in the expansion, interpolation points for these dimensions are based on Gauss-Legendre rules if non-nested, Gauss-Patterson rules if nested, and Newton-Cotes points in the case of piecewise bases. Again, when probability integrals are evaluated, only the aleatory random variable domain is integrated, leaving behind a polynomial relationship between the statistics and the remaining design/state/epistemic variables.

Optional Keywords regarding method outputs

Each of these sampling specifications refer to sampling on the SC approximation for the purposes of generating approximate statistics.

- `sample_type`
- `samples`

- seed
- fixed_seed
- rng
- probability_refinement
- distribution
- reliability_levels
- response_levels
- probability_levels
- gen_reliability_levels

Since SC approximations are formed on structured grids, there should be no ambiguity with simulation sampling for generating the SC expansion.

When using the `probability_refinement` control, the number of refinement samples is not under the user's control (these evaluations are approximation-based, so management of this expense is less critical). This option allows for refinement of probability and generalized reliability results using importance sampling.

Multi-fidelity UQ

When using multifidelity UQ, the high fidelity expansion generated from combining the low fidelity and discrepancy expansions retains the polynomial form of the low fidelity expansion (only the coefficients are updated). Refer to [polynomial_chaos](#) for information on the multifidelity interpretation of array inputs for `quadrature_order` and `sparse_grid_level`.

Usage Tips

If n is small, then tensor-product Gaussian quadrature is again the preferred choice. For larger n , tensor-product quadrature quickly becomes too expensive and the sparse grid approach is preferred. For self-consistency in growth rates, nested rules employ restricted exponential growth (with the exception of the `dimension_adaptive p_refinement generalized` case) for consistency with the linear growth used for non-nested Gauss rules (integrand precision $i = 4l + 1$ for sparse grid level l and $i = 2m - 1$ for tensor grid order m).

Additional Resources

Dakota provides access to SC methods through the `NonDStochCollocation` class. Refer to the Uncertainty Quantification Capabilities chapter of the Users Manual [5] and the Stochastic Expansion Methods chapter of the Theory Manual [16] for additional information on the SC algorithm.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Integration and Expansion Moments](#)
- [Probability Density](#)
- [Level Mappings](#)
- [Variance-Based Decomposition \(Sobol' Indices\)](#)

Examples

```
method,
  stoch_collocation
    sparse_grid_level = 2
    samples = 10000 seed = 12347 rng rnum2
    response_levels = .1 1. 50. 100. 500. 1000.
    variance_based_decomp
```

Theory

As mentioned above, a value-based expansion takes the form

$$R = \sum_{i=1}^{N_p} r_i L_i(\xi)$$

The i^{th} interpolation polynomial assumes the value of 1 at the i^{th} collocation point and 0 at all other collocation points, involving either a global Lagrange polynomial basis or local piecewise splines. It is easy to see that the approximation reproduces the response values at the collocation points and interpolates between these values at other points. A gradient-enhanced expansion (selected via the `use_derivatives` keyword) involves both type 1 and type 2 basis functions as follows:

$$R = \sum_{i=1}^{N_p} [r_i H_i^{(1)}(\xi) + \sum_{j=1}^n \frac{dr_i}{d\xi_j} H_{ij}^{(2)}(\xi)]$$

where the i^{th} type 1 interpolant produces 1 for the value at the i^{th} collocation point, 0 for values at all other collocation points, and 0 for derivatives (when differentiated) at all collocation points, and the ij^{th} type 2 interpolant produces 0 for values at all collocation points, 1 for the j^{th} derivative component at the i^{th} collocation point, and 0 for the j^{th} derivative component at all other collocation points. Again, this expansion reproduces the response values at each of the collocation points, and when differentiated, also reproduces each component of the gradient at each of the collocation points. Since this technique includes the derivative interpolation explicitly, it eliminates issues with matrix ill-conditioning that can occur in the gradient-enhanced PCE approach based on regression. However, the calculation of high-order global polynomials with the desired interpolation properties can be similarly numerically challenging such that the use of local cubic splines is recommended due to numerical stability.

7.2.54.1 p_refinement

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [p_refinement](#)

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	<code>uniform</code>	Refine an expansion uniformly in all dimensions.
			<code>dimension_adaptive</code>	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

7.2.54.2.3 local_adaptive

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [h_refinement](#)
- [local_adaptive](#)

Planned future capability for local pointwise refinement within a generalized sparse grid.

Specification

Alias: none

Argument(s): none

Description

Sparse grid interpolation admits approaches for pointwise local refinement within the general framework of generalized sparse grids. This algorithmic capability is currently in a partial prototype stage.

7.2.54.3 max_refinement_iterations

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [max_refinement_iterations](#)

Maximum number of expansion refinement iterations

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

Limits the number of times the expansion can be refined under various refinement strategies.

Examples

```
method,  
  polynomial_chaos  
  dimension_adaptive generalized  
  p_refinement  
  max_refinement_iterations = 20  
  convergence_tol = 1.e-4  
  sparse_grid_level = 1
```

7.2.54.4 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)
- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.54.5 `metric_scale`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [metric_scale](#)

define scaling of statistical metrics when adapting UQ surrogates

Specification

Alias: none

Argument(s): none

Default: relative

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	scale of refinement metric (Group 1)	relative	relative scaling of statistical metrics when adapting UQ surrogates
			absolute	use of absolute statistical metrics when adapting UQ surrogates

Description

When adapting a UQ surrogate model, e.g., by change in response covariance matrix or level mappings, this option controls the use of scaling. The `absolute` option indicates that there is no scaling such that the statistical change is compared directly to the convergence tolerance. The `relative` option indicates that the change is measured relative to the current reference value (which evolves during the refinement), such that the convergence tolerance controls the relative change.

Default Behavior

The default is `relative`.

Default Behavior**Expected Output****Usage Tips****Additional Discussion**7.2.54.6 `quadrature_order`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [quadrature_order](#)

Order for tensor-products of Gaussian quadrature rules

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional		dimension_ - preference	A set of weights specifying the relative importance of each uncertain variable (dimension) Enforce use of nested quadrature rules if available
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of non-nested quadrature rules
			non_nested	

Description

Multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order`, and, optionally, `dimension_preference`). The default rule selection is to employ `non_nested` Gauss rules including Gauss-Hermite (for normals or transformed normals), Gauss-Legendre (for uniforms or transformed uniforms), Gauss-Jacobi (for betas), Gauss-Laguerre (for exponentials), generalized Gauss-Laguerre (for gammas), and numerically-generated Gauss rules (for other distributions when using an Extended basis). For the case of `p_refinement` or the case of an explicit `nested` override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse. By specifying a `dimension_preference`, where higher preference leads to higher order polynomial resolution, the tensor grid may be rendered anisotropic. The dimension specified to have highest preference will be set to the specified `quadrature_order` and all other dimensions will be reduced in proportion to their reduced preference; any non-integral portion is truncated. To synchronize with tensor-product integration, a tensor-product expansion is used, where the order p_i of the expansion in each dimension is selected to be half of the integrand precision available from the rule in use, rounded down. In the case of non-nested Gauss rules with integrand precision $2m_i - 1$, p_i is one less than the quadrature order m_i in each dimension (a one-dimensional expansion contains the same number of terms, $p + 1$, as the number of Gauss points). The total number of terms, N , in a tensor-product expansion involving n uncertain input variables is

$$N = 1 + P = \prod_{i=1}^n (p_i + 1)$$

In some advanced use cases (e.g., multifidelity UQ), multiple grid resolutions can be employed; for this reason, the `quadrature_order` specification supports an array input.

A corresponding sequence specification is documented at, e.g., [quadrature_order_sequence](#) and [quadrature_order_sequence](#)

Level to use in sparse grid integration or interpolation

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
Optional		dimension_preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
Optional (<i>Choose One</i>)	Group 1	nodal	Employ a nodal sparse grid construction in stochastic collocation
		hierarchical	Employ a hierarchical sparse grid construction
Optional (<i>Choose One</i>)	Quadrature Rule Growth (Group 2)	restricted	Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

			unrestricted	Override the default restriction of growth rates for nested and non-nested rules that are by default synchronized for consistency.
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 3)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multi-dimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level` and, optionally, `dimension_preference`). The underlying one-dimensional integration rules are the same as for the tensor-product quadrature case; however, the default rule selection is nested for sparse grids (Genz-Keister for normals/transformed normals and Gauss-Patterson for uniforms/transformed uniforms). This default can be overridden with an explicit `non_nested` specification (resulting in Gauss-Hermite for normals/transformed normals and Gauss-Legendre for uniforms/transformed uniforms). As for tensor quadrature, the `dimension_preference` specification enables the use of anisotropic sparse grids (refer to the PCE description in the User's Manual for the anisotropic index set constraint definition). Similar to anisotropic tensor grids, the dimension with greatest preference will have resolution at the full `sparse_grid_level` and all other dimension resolutions will be reduced in proportion to their reduced preference. For PCE with either isotropic or anisotropic sparse grids, a summation of tensor-product expansions is used, where each anisotropic tensor-product quadrature rule underlying the sparse grid construction results in its own anisotropic tensor-product expansion as described in case 1. These anisotropic tensor-product expansions are summed into a sparse PCE using the standard Smolyak summation (again, refer to the User's Manual for additional details). As for `quadrature_order`, the `sparse_grid_level` specification admits an array input for enabling specification of multiple grid resolutions used by certain advanced solution methodologies.

A corresponding sequence specification is documented at, e.g., [sparse_grid_level_sequence](#) and [sparse_grid_level_sequence](#)

7.2.54.7.1 `dimension_preference`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [dimension_preference](#)

A set of weights specifying the relative importance of each uncertain variable (dimension)

Specification

Alias: none

Argument(s): REALLIST

Default: isotropic grids

Description

A set of weights specifying the relative importance of each uncertain variable (dimension). Using this specification leads to anisotropic integrations with differing refinement levels for different random dimensions.

See Also

These keywords may also be of interest:

- [sobol](#)
- [decay](#)

7.2.54.7.2 nodal

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [nodal](#)

Employ a nodal sparse grid construction in stochastic collocation

Specification

Alias: none

Argument(s): none

Default: nodal

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The nodal formulation does not require nested interpolation rules and is therefore more generally applicable. However, in the context of adaptive refinement, it can suffer from loss of precision due to subtractive cancellation.

7.2.54.7.3 hierarchical

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [hierarchical](#)

Employ a hierarchical sparse grid construction

Specification

Alias: none

Argument(s): none

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The hierarchical formulation requires nested interpolation rules as it utilizes increments in collocation points along with hierarchical weights defined from a hierarchical basis formulation.

This keyword requests the hierarchical formulation, which has benefits for adaptive refinement by supporting direct computation of increments in targeted statistics (e.g. mean, covariance, reliability indices), avoiding loss of precision from subtractive cancellation.

7.2.54.7.4 restricted

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the unrestricted keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.54.7.5 unrestricted

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)

- [sparse_grid_level](#)
- [unrestricted](#)

Override the default restriction of growth rates for nested and non-nested rules that are by default synchronized for consistency.

Specification

Alias: none

Argument(s): none

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.54.7.6 nested

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [nested](#)

Enforce use of nested quadrature rules if available

Specification

Alias: none

Argument(s): none

Default: quadrature: `non_nested` unless automated refinement; sparse grids: `nested`

Description

Enforce use of nested quadrature rules if available. For instance if the aleatory variables are Gaussian use the Nested Genz-Keister rule instead of the default non-nested Gauss-Hermite rule variables are

7.2.54.7.7 non_nested

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sparse_grid_level](#)
- [non_nested](#)

Enforce use of non-nested quadrature rules

Specification

Alias: none

Argument(s): none

Description

Enforce use of non-nested quadrature rules if available. For instance if the aleatory variables are Gaussian use the non-nested Gauss-Hermite rule

7.2.54.8 piecewise

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [piecewise](#)

Use piecewise local basis functions

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

SC also supports the option of piecewise local basis functions. These are piecewise linear splines, or in the case of gradient-enhanced interpolation via the `use_derivatives` specification, piecewise cubic Hermite splines. Both of these basis selections provide local support only over the range from the interpolated point to its nearest 1D neighbors (within a tensor grid or within each of the tensor grids underlying a sparse grid), which exchanges the fast convergence of global bases for smooth functions for robustness in the representation of nonsmooth response functions (that can induce Gibbs oscillations when using high-order global basis functions). When local basis functions are used, the usage of nonequidistant collocation points (e.g., the Gauss point selections described above) is not well motivated, so equidistant Newton-Cotes points are employed in this case, and all random variable types are transformed to standard uniform probability space.

7.2.54.9 askey

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

7.2.54.10 wiener

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

See Also

These keywords may also be of interest:

- [polynomial_chaos](#)
- [askey](#)

7.2.54.11 use_derivatives

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.54.12 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: samples

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.54.13 sample_type

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Sample Type (Group 1)	Dakota Keyword lhs	Dakota Keyword Description Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.54.13.1 lhs

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.54.13.2 random

- [Keywords Area](#)
- [method](#)

- [stoch_collocation](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.54.14 rng

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.54.14.1 mt19937

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.54.14.2 `rnum2`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.54.15 probability_refinement

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_refinement](#)

Allow refinement of probability and generalized reliability results using importance sampling

Topics

This keyword is related to the topics:

- [reliability_methods](#)

Specification

Alias: sample_refinement

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group Importance Sampling Approach (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		import	Importance sampling option for probability refinement
			adapt_import	Importance sampling option for probability refinement
			mm_adapt_import	Importance sampling option for probability refinement
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.

Description

The `probability_refinement` allows refinement of probability and generalized reliability results using importance sampling. If one specifies `probability_refinement`, there are some additional options. One can specify which type of importance sampling to use (`import`, `adapt_import`, or `mm_adapt_import`). Additionally, one can specify the number of refinement samples to use with `refinement_samples` and the seed to use with `seed`.

The `probability_refinement` density reweighting accounts originally was developed based on Gaussian distributions. It now accounts for additional non-Gaussian cases.

7.2.54.15.1 import

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_refinement](#)
- [import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level).

7.2.54.15.2 adapt_import

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_refinement](#)
- [adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`adapt_import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). This continues iteratively until the failure probability estimate converges.

7.2.54.15.3 mm_adapt_import

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_refinement](#)
- [mm_adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

7.2.54.15.4 refinement_samples

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_refinement](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the `initial_samples` in a sampling design.

7.2.54.16 `final_moments`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Output standardized moments and include them within the set of final statistics.
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
```

```

samples = 50 seed = 1234
response_levels = 3.6e+11 1.2e+05 3.5e+05
final_moments central

```

Overriding the default to `none` as follows:

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

allows associated nested model mappings to be simplified from:

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.

```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```

model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.

```

7.2.54.16.1 none

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```

method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none

```

7.2.54.16.2 standard

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

7.2.54.16.3 central

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.54.17 response_levels

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors       = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas            = 12., 30.
  betas             = 250., 590.
  descriptors       = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs         = 3 4
  abscissas         = 5 8 10 .1 .2 .3 .4
  counts            = 17 21 0 12 24 12 0
  descriptors       = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs         = 2
  abscissas         = 3 4
  counts            = 1 1
  descriptors       = 'TF3h'
```

```

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians

```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Bin Lower	Bin Upper	Density Value
2.7604749078e+11	3.6000000000e+11	5.3601733194e-12

6.5000000000e+04	2.9000000000e-01		
7.0000000000e+04	9.0000000000e-02		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
3.5000000000e+05	5.2000000000e-01		
4.0000000000e+05	9.0000000000e-02		
4.5000000000e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.54.17.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.54.17.2 compute

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels
			reliabilities	Computes reliabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
```

```

                                3.5e+05 4.0e+05 4.5e+05
compute reliabilities

```

7.2.54.17.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```

method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities

```

7.2.54.17.2.2 reliabilities

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)

- [compute](#)
- [reliabilities](#)

Computes reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `reliabilities` keyword directs Dakota to compute reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the reliabilities are not computed by default. To change this behavior, the `reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.54.17.2.3 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.54.17.2.4 system

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system

			parallel	Aggregate response statistics assuming a parallel system
--	--	--	--------------------------	--

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.54.18 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```

method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors       = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas            = 12., 30.

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.54.18.1 num_probability_levels

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [probability_levels](#)
- [num_probability_levels](#)

Specify which `probability_levels` correspond to which response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: `probability_levels` evenly distributed among response functions

Description

See parent page

7.2.54.19 reliability_levels

- [Keywords Area](#)
- [method](#)

- [stoch_collocation](#)
- [reliability_levels](#)

Specify reliability levels at which the response values will be estimated

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_reliability_levels	Specify which <code>reliability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF reliabilities by projecting out the prescribed number of sample standard deviations from the sample mean.

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.54.21 distribution

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Distribution Type (CDF/CCDF) (Group 1)	cumulative	Computes statistics according to cumulative functions

			complementary	Computes statistics according to complementary cumulative functions
--	--	--	-------------------------------	---

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.54.21.1 cumulative

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.54.21.2 complementary

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.54.22 variance_based_decomp

- [Keywords Area](#)

- [method](#)
- [stoch_collocation](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		interaction_order	Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.
	Optional		drop_tolerance	Suppresses output of sensitivity indices with values lower than this tolerance

Description

Dakota can calculate sensitivity indices through variance-based decomposition using the keyword `variance_based_decomp`. This approach decomposes main, interaction, and total effects in order to identify the most important variables and combinations of variables in contributing to the variance of output quantities of interest.

Default Behavior

Because of processing overhead and output volume, `variance_based_decomp` is inactive by default, unless required for dimension-adaptive refinement using Sobol' indices.

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects, total effects, and any interaction effects will be reported. Each of these effects represents the percent contribution to the variance in the model response, where main effects include the aggregated set of *univariate* terms for each individual variable, interaction effects represent the set of *mixed* terms (the complement of the univariate set), and total effects represent the *complete* set of terms (univariate and mixed) that contain each individual variable. The aggregated set of main and interaction sensitivity indices will sum to one, whereas the sum of total effects sensitivity indices will be greater than one due to redundant counting of mixed terms.

Usage Tips

An important consideration is that the number of possible interaction terms grows exponentially with dimension and expansion order. To mitigate this, both in terms of compute time and output volume, possible interaction effects are suppressed whenever no contributions are present due to the particular form of an expansion. In addition, the `interaction_order` and `drop_tolerance` controls can further limit the computational and output requirements.

Examples

```
method,
  polynomial_chaos # or stoch_collocation
  sparse_grid_level = 3
  variance_based_decomp interaction_order = 2
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76]: "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [90].

7.2.54.22.1 interaction_order

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [variance_based_decomp](#)
- [interaction_order](#)

Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

Specification

Alias: none

Argument(s): INTEGER

Default: Unrestricted (VBD includes all interaction orders present in the expansion)

Description

The `interaction_order` option has been added to allow suppression of higher-order interactions, since the output volume (and memory and compute consumption) of these results could be extensive for high dimensional problems (note: the previous `univariate_effects` specification is equivalent to `interaction_order = 1` in the current specification). Similar to suppression of interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to again save compute and memory resources and reduce output volume)

7.2.54.22.2 drop_tolerance

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,
  sampling
    sample_type lhs
    samples = 100
    variance_based_decomp
    drop_tolerance = 0.001
```

7.2.54.23 `diagonal_covariance`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: `diagonal_covariance` for response vector > 10 ; else `full_covariance`

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.54.24 full_covariance

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.54.25 import_approx_points_file

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [import_approx_points_file](#)

Filename for points at which to evaluate the PCE/SC surrogate

Specification

Alias: none

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

Default Behavior No import of points at which to evaluate the surrogate.

Expected Output The PCE/SC surrogate model will be evaluated at the list of points (input variable values) provided in the file and results tabulated and/or statistics computed at them, depending on the method context.

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_approx_points_file = 'import.mcmc_annot.dat'
    annotated
```

7.2.54.25.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [import_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
--	-------------------	----------------------	----------------	----------------------------

	Optional	header	Enable header row in custom-annotated tabular file
	Optional	eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional	interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1         0.0002  0.26           0.76
2              0.90009    1.1 0.0001996404857  0.2601620081  0.759955
3              0.89991    1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.54.25.1.1 header

- [stoch_collocation](#)
- [import_approx_points_file](#)
- [custom_annotated](#)

- [interface_id](#)

Enable interface ID column in custom-annotated tabular file

Specification

Alias: none

Argument(s): none

Default: no interface_id column

Description

See description of parent `custom_annotated`

7.2.54.25.2 annotated

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [import_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated header eval_id`

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.54.25.3 freeform

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [import_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.54.25.4 active_only

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [import_approx_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.54.26 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional Optional (<i>Choose One</i>)	Description of Group Tabular Format (Group 1)	Dakota Keyword custom_annotated	Dakota Keyword Description Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.54.26.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: `annotated` format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857  0.2601620081      0.759955
3              0.89991      1.1 0.0002003604863  0.2598380081      0.760045
...
```

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [export_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009    1.1 0.0001996404857 0.2601620081 0.759955

...
```

7.2.54.26.3 freeform

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [export_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.54.27 seed

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.54.28 fixed_seed

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.54.29 model_pointer

- [Keywords Area](#)
- [method](#)
- [stoch_collocation](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6

	Optional		max_refinement_ - iterations	Maximum number of expansion refinement iterations
	Optional		convergence_ - tolerance	Stopping criterion based on objective function or statistics convergence

	Optional		metric_scale	define scaling of statistical metrics when adapting UQ surrogates
	Optional		statistics_mode	type of statistical metric roll-up for multifidelity UQ methods
	Optional		allocation_control	Sample allocation approach for multifidelity expansions
	Optional		discrepancy_emulation	Formulation for emulation of model discrepancies.
	Required (Choose One)	Interpolation Grid Type (Group 2)	quadrature_order_sequence	Sequence of quadrature orders used in a multi-stage expansion
			sparse_grid_level_sequence	Sequence of sparse grid levels used in a multi-stage expansion
	Optional (Choose One)	Basis Polynomial Family (Group 3)	piecewise	Use piecewise local basis functions
			askey	Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

			wiener	Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional		sample_type	Selection of sampling strategy
	Optional		rng	Selection of a random number generator
	Optional		probability_refinement	Allow refinement of probability and generalized reliability results using importance sampling
	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional		response_levels	Values at which to estimate desired statistics for each response
	Optional		probability_levels	Specify probability levels at which to estimate the corresponding response value

	Optional		reliability_levels	Specify reliability levels at which the response values will be estimated
	Optional		gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional		distribution	Selection of cumulative or complementary cumulative functions
	Optional		variance_based_decomp	Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects
	Optional (<i>Choose One</i>)	Covariance Type (Group 4)	diagonal_covariance	Display only the diagonal terms of the covariance matrix
			full_covariance	Display the full covariance matrix
	Optional		import_approx_points_file	Filename for points at which to evaluate the PCE/SC surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional		model_pointer	Identifier for model block to be used by a method

Description

As described in [stoch_collocation](#), stochastic collocation is a general framework for approximate representation of random response functions in terms of finite-dimensional interpolation bases, using interpolation polynomials that

may be either local or global and either value-based or gradient-enhanced.

In the multifidelity case, we decompose this interpolant expansion into several constituent expansions, one per model form or solution control level. In a bi-fidelity case with low-fidelity (LF) and high-fidelity (HF) models and an additive discrepancy approach, we have:

$$R = \sum_{i=1}^{N_p^{LF}} r_i^{LF} L_i(\xi) + \sum_{i=1}^{N_p^{HF}} \delta_i L_i(\xi)$$

where δ_i is a coefficient for the discrepancy expansion.

The same specification options are available as described in [stoch_collocation](#) with one key difference: the coefficient estimation inputs change from a scalar input for a single expansion to a *sequence* specification for a low-fidelity expansion followed by multiple discrepancy expansions.

To obtain the coefficients r_i and δ_i for each of the expansions, the following options are provided:

1. multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order_sequence`, and, optionally, `dimension_preference`).
2. multidimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level_sequence` and, optionally, `dimension_preference`)

It is important to note that, while `quadrature_order_sequence` and `sparse_grid_level_sequence` are array inputs, only one scalar from these arrays is active at a time for a particular expansion estimation. In order to specify anisotropy in resolution across the random variable set, a `dimension_preference` specification can be used to augment these scalar specifications.

Multifidelity UQ using SC requires that the model selected for iteration by the method specification is a multifidelity surrogate model (see [hierarchical](#)), which defines an `ordered_model_sequence` (see [hierarchical](#)). Two types of hierarchies are supported: (i) a hierarchy of model forms composed from more than one model within the `ordered_model_sequence`, or (ii) a hierarchy of discretization levels comprised from a single model within the `ordered_model_sequence` which in turn specifies a `solution_level_control` (see [solution_level_control](#)).

In both cases, an expansion will first be formed for the low fidelity model or coarse discretization, using the first value within the coefficient estimation sequence, along with any specified refinement strategy. Second, expansions are formed for one or more model discrepancies (the difference between response results if `additive_correction` or the ratio of results if `multiplicative_correction`), using all subsequent values in the coefficient estimation sequence (if the sequence does not provide a new value, then the previous value is reused) along with any specified refinement strategy. The number of discrepancy expansions is determined by the number of model forms or discretization levels in the hierarchy.

After formation and refinement of the constituent expansions, each of the expansions is combined (added or multiplied) into an expansion that approximates the high fidelity model, from which the final set of statistics are generated.

Additional Resources

Dakota provides access to multifidelity SC methods through the `NonDMultilevelStochCollocation` class. Refer to the Stochastic Expansion Methods chapter of the Theory Manual [16] for additional information on the Multifidelity SC algorithm.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Integration and Expansion Moments](#) (expansion moments only)
- [Probability Density](#)
- [Level Mappings](#)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Examples

```
method,
  multifidelity_stoch_collocation
  model_pointer = 'HIERARCH'
  sparse_grid_level_sequence = 4 3 2

model,
  id_model = 'HIERARCH'
  surrogate_hierarchical
  ordered_model_fidelities = 'LF' 'MF' 'HF'
  correction_additive_zeroth_order
```

7.2.55.1 p_refinement

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [p_refinement](#)

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

7.2.55.1.1 uniform

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [p_refinement](#)
- [uniform](#)

Refine an expansion uniformly in all dimensions.

Specification

Alias: none

Argument(s): none

Description

The quadrature_order or sparse_grid_level are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the uniform refinement case with regression approaches, the expansion_order is ramped by one on each iteration while the oversampling ratio (either defined by collocation_ratio or inferred from collocation_points based on the initial expansion) is held fixed.

7.2.55.1.2 dimension_adaptive

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [p_refinement](#)
- [dimension_adaptive](#)

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Dimension Adaptivity Estimation Approach (Group 1)	Dakota Keyword sobol	Dakota Keyword Description Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.
			generalized	Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Description

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to hold higher 'importance' in resolving statistical quantities of interest.

Dimension importance must be estimated as part of the refinement process. Techniques include either sobol or generalized for stochastic collocation and either sobol, decay, or generalized for polynomial chaos. Each of these automated refinement approaches makes use of the `max_iterations` and `convergence_tolerance` iteration controls.

7.2.55.1.2.1 sobol

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [p_refinement](#)
- [dimension_adaptive](#)
- [sobol](#)

Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.

Specification

Alias: none

Argument(s): none

Default: generalized

Description

Determine dimension preference for refinement of a stochastic expansion from the total Sobol' sensitivity indices obtained from global sensitivity analysis. High indices indicate high importance for resolving statistical quantities of interest and therefore result in high dimension preference.

Examples

```
method,  
    polynomial_chaos  
    sparse_grid_level = 3  
    dimension_adaptive p_refinement sobol  
    max_iterations = 20  
    convergence_tol = 1.e-4
```

7.2.55.1.2.2 generalized

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [p_refinement](#)
- [dimension_adaptive](#)
- [generalized](#)

Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Specification

Alias: none

Argument(s): none

Description

The generalized sparse grid algorithm is a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement generalized
  max_iterations = 20
  convergence_tol = 1.e-4
```

7.2.55.2 h_refinement

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [h_refinement](#)

Employ h-refinement to refine the grid

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	h-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.

			dimension_-adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.
			local_adaptive	Planned future capability for local pointwise refinement within a generalized sparse grid.

Description

Automated expansion refinement can be selected as either `p_refinement` or `h_refinement`, and either refinement specification can be either `uniform` or `dimension_adaptive`. The `dimension_adaptive` case can be further specified as either `sobol` or `generalized` (decay not supported). Each of these automated refinement approaches makes use of the `max_iterations` and `convergence_tolerance` iteration controls. The `h_refinement` specification involves use of the same piecewise interpolants (linear or cubic Hermite splines) described above for the piecewise specification option (it is not necessary to redundantly specify `piecewise` in the case of `h_refinement`). In future releases, the hierarchical interpolation approach will enable local refinement in addition to the current `uniform` and `dimension_adaptive` options.

7.2.55.2.1 uniform

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [h_refinement](#)
- [uniform](#)

Refine an expansion uniformly in all dimensions.

Specification

Alias: none

Argument(s): none

Description

The `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the uniform refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed.

	Required/Optional <i>Required (Choose One)</i>	Description of Group Dimension Adaptivity Estimation Approach (Group 1)	Dakota Keyword	Dakota Keyword Description
			sobol	Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.
			generalized	Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Description

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to hold higher 'importance' in resolving statistical quantities of interest.

Dimension importance must be estimated as part of the refinement process. Techniques include either `sobol` or `generalized` for stochastic collocation and either `sobol`, `decay`, or `generalized` for polynomial chaos. Each of these automated refinement approaches makes use of the `max_iterations` and `convergence_tolerance` iteration controls.

7.2.55.2.2.1 `sobol`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [h_refinement](#)

- [dimension_adaptive](#)
- [sobol](#)

Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.

Specification

Alias: none

Argument(s): none

Default: generalized

Description

Determine dimension preference for refinement of a stochastic expansion from the total Sobol' sensitivity indices obtained from global sensitivity analysis. High indices indicate high importance for resolving statistical quantities of interest and therefore result in high dimension preference.

Examples

```
method,  
    polynomial_chaos  
    sparse_grid_level = 3  
    dimension_adaptive p_refinement sobol  
    max_iterations = 20  
    convergence_tol = 1.e-4
```

7.2.55.2.2.2 generalized

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [h_refinement](#)
- [dimension_adaptive](#)
- [generalized](#)

Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Specification

Alias: none

Argument(s): none

Description

The generalized sparse grid algorithm is a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement generalized
  max_iterations = 20
  convergence_tol = 1.e-4
```

7.2.55.2.3 local_adaptive

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [h_refinement](#)
- [local_adaptive](#)

Planned future capability for local pointwise refinement within a generalized sparse grid.

Specification

Alias: none

Argument(s): none

Description

Sparse grid interpolation admits approaches for pointwise local refinement within the general framework of generalized sparse grids. This algorithmic capability is currently in a partial prototype stage.

7.2.55.3 max_refinement_iterations

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [max_refinement_iterations](#)

Maximum number of expansion refinement iterations

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

Limits the number of times the expansion can be refined under various refinement strategies.

Examples

```
method,
  polynomial_chaos
  dimension_adaptive_generalized
  p_refinement
  max_refinement_iterations = 20
  convergence_tol = 1.e-4
  sparse_grid_level = 1
```

7.2.55.4 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)

- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.55.5 metric_scale

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [metric_scale](#)

define scaling of statistical metrics when adapting UQ surrogates

Specification

Alias: none

Argument(s): none

Default: relative

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group scale of refinement metric (Group 1)	Dakota Keyword relative	Dakota Keyword Description relative scaling of statistical metrics when adapting UQ surrogates
			absolute	use of absolute statistical metrics when adapting UQ surrogates

Description

When adapting a UQ surrogate model, e.g., by change in response covariance matrix or level mappings, this option controls the use of scaling. The `absolute` option indicates that there is no scaling such that the statistical change is compared directly to the convergence tolerance. The `relative` option indicates that the change is measured relative to the current reference value (which evolves during the refinement), such that the convergence tolerance controls the relative change.

Default Behavior

The default is `relative`.

7.2.55.7 allocation_control

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [allocation_control](#)

Sample allocation approach for multifidelity expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multifidelity Sample Allocation Control (Group 1)	greedy	Sample allocation based on greedy refinement within multifidelity stochastic collocation

Description

Multifidelity surrogate approaches, including polynomial chaos, stochastic collocation, and function train, can optionally employ an integrated greedy competition across the model sequence, where each model index can supply one or more refinement candidates which are competed to determine the candidate with the greatest impact on the QoI statistics per unit cost. This greedy competition implicitly determines the optimal sample allocation across model indices.

Default Behavior

The default, when `allocation_control` is not specified, is to compute or adapt separately for each model index (individual instead of integrated refinement).

7.2.55.7.1 greedy

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [allocation_control](#)
- [greedy](#)

Sample allocation based on greedy refinement within multifidelity stochastic collocation

Specification

Alias: none

Argument(s): none

Description

Multifidelity stochastic collocation supports greedy refinement strategies using tensor and sparse grids for both nodal and hierarchical collocation approaches. The key idea is that each level of the model hierarchy being approximated can generate one or more candidates for refinement. These candidates are competed against each other within an integrated competition, and the candidate that induces the largest change in the statistical QoI (response covariance by default, or results of any level mappings when specified), normalized by relative cost of evaluating the candidate, is selected and then used to generate additional candidates for consideration at its model level.

Examples

The following example of greedy multifidelity stochastic collocation using nodal interpolation starts from a zeroth-order expansion (a constant) for each level, and generates uniform candidate refinements for each level that are competed in a greedy competition. The number of new samples for the incremented candidate expansion order is determined from the quadrature rules of the new sparse grid level. In this case, the number of candidates for each level is limited to one uniform refinement of the current sparse grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_stoch_collocation
    nodal
    allocation_control greedy
    p_refinement uniform
    sparse_grid_level_sequence = 0 unrestricted
    convergence_tolerance 1.e-3
```

The next example employs generalized sparse grids and hierarchical interpolation. Each level starts from a level 0 reference grid (a single point) and generates multiple admissible index set candidates. The full set of candidates across all levels is competed within a unified greedy competition, where the greedy selection metric is the induced change in the statistical QoI, normalized by the aggregate simulation cost of the index set candidate. In this case, there are multiple candidates for each level and the number of candidates grows rapidly with random dimension and grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_stoch_collocation
    hierarchical
    allocation_control greedy
    p_refinement dimension_adaptive generalized
    sparse_grid_level_sequence = 0 unrestricted
    convergence_tolerance 1.e-8
```

7.2.55.8 discrepancy_emulation

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Discrepancy Emulation Approach (Group 1)	distinct	Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
    multilevel_polynomial_chaos
    expansion_order_sequence = 2
    collocation_ratio = .9
    orthogonal_matching_pursuit
    discrepancy_emulation recursive
```

7.2.55.8.1 `distinct`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [discrepancy_emulation](#)
- [distinct](#)

Distinct formulation for emulation of model discrepancies.

Specification

Alias: paired

Argument(s): none

Description

The `distinct` approach to discrepancy emulation directly approximate the difference or ratio between the evaluations of two models or solution levels. Refer to the parent documentation node for additional discussion.

Examples

7.2.55.8.2 recursive

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [discrepancy_emulation](#)
- [recursive](#)

Recursive formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Description

The `recursive` approach to discrepancy emulation approximates a difference or ratio among the new model evaluation and the emulator approximation of the previous model. Refer to the parent documentation node for additional discussion.

Examples

7.2.55.9 quadrature_order_sequence

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [quadrature_order_sequence](#)

Sequence of quadrature orders used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		dimension_preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Each level entry of the `quadrature_order_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support quadrature order sequences include multilevel polynomial chaos, multifidelity polynomial chaos, or multifidelity stochastic collocation expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [quadrature_order](#)

7.2.55.10.2 `nodal`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)

- [sparse_grid_level_sequence](#)
- [nodal](#)

Employ a nodal sparse grid construction in stochastic collocation

Specification

Alias: none

Argument(s): none

Default: nodal

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The nodal formulation does not require nested interpolation rules and is therefore more generally applicable. However, in the context of adaptive refinement, it can suffer from loss of precision due to subtractive cancellation.

7.2.55.10.3 hierarchical

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sparse_grid_level_sequence](#)
- [hierarchical](#)

Employ a hierarchical sparse grid construction

Specification

Alias: none

Argument(s): none

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The hierarchical formulation requires nested interpolation rules as it utilizes increments in collocation points along with hierarchical weights defined from a hierarchical basis formulation.

This keyword requests the hierarchical formulation, which has benefits for adaptive refinement by supporting direct computation of increments in targeted statistics (e.g. mean, covariance, reliability indices), avoiding loss of precision from subtractive cancellation.

7.2.55.10.4 restricted

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sparse_grid_level_sequence](#)

- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the unrestricted keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.55.10.5 `unrestricted`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sparse_grid_level_sequence](#)
- [unrestricted](#)

Override the default restriction of growth rates for nested and non-nested rules that are by default synchronized for consistency.

Specification

Alias: none

Argument(s): none

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed

sequences." To override this default behavior in the case of sparse grids, the unrestricted keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the dimension_adaptive p_refinement generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.55.10.6 nested

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sparse_grid_level_sequence](#)
- [nested](#)

Enforce use of nested quadrature rules if available

Specification

Alias: none

Argument(s): none

Default: quadrature: non_nested unless automated refinement; sparse grids: nested

Description

Enforce use of nested quadrature rules if available. For instance if the aleatory variables are Gaussian use the Nested Genz-Keister rule instead of the default non-nested Gauss-Hermite rule variables are

7.2.55.10.7 non_nested

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sparse_grid_level_sequence](#)
- [non_nested](#)

Enforce use of non-nested quadrature rules

Specification

Alias: none

Argument(s): none

Description

Enforce use of non-nested quadrature rules if available. For instance if the aleatory variables are Gaussian use the non-nested Gauss-Hermite rule

7.2.55.11 piecewise

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [piecewise](#)

Use piecewise local basis functions

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

SC also supports the option of piecewise local basis functions. These are piecewise linear splines, or in the case of gradient-enhanced interpolation via the `use_derivatives` specification, piecewise cubic Hermite splines. Both of these basis selections provide local support only over the range from the interpolated point to its nearest 1D neighbors (within a tensor grid or within each of the tensor grids underlying a sparse grid), which exchanges the fast convergence of global bases for smooth functions for robustness in the representation of nonsmooth response functions (that can induce Gibbs oscillations when using high-order global basis functions). When local basis functions are used, the usage of nonequidistant collocation points (e.g., the Gauss point selections described above) is not well motivated, so equidistant Newton-Cotes points are employed in this case, and all random variable types are transformed to standard uniform probability space.

7.2.55.12 askey

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

See Also

These keywords may also be of interest:

- [wiener](#)

7.2.55.13 wiener

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

See Also

These keywords may also be of interest:

- [polynomial_chaos](#)
- [askey](#)

7.2.55.14 use_derivatives

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.55.15 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: samples

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

- [method](#)
- [multifidelity_stoch_collocation](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Sample Type (Group 1)	Dakota Keyword lhs	Dakota Keyword Description Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
```

```
samples = 20
seed = 83921
```

7.2.55.16.1 lhs

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
  samples = 20
```

7.2.55.16.2 random

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.55.17 rng

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (`mt19937`)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.55.17.1 mt19937

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
```

```
samples = 10
seed = 98765
rng mt19937
```

7.2.55.17.2 rnum2

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.55.18 probability_refinement

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_refinement](#)

Allow refinement of probability and generalized reliability results using importance sampling

Topics

This keyword is related to the topics:

- [reliability_methods](#)

Specification

Alias: sample_refinement

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Importance Sampling Approach (Group 1)	import	Importance sampling option for probability refinement
			adapt_import	Importance sampling option for probability refinement
			mm_adapt_import	Importance sampling option for probability refinement
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.

Description

The `probability_refinement` allows refinement of probability and generalized reliability results using importance sampling. If one specifies `probability_refinement`, there are some additional options. One can specify which type of importance sampling to use (`import`, `adapt_import`, or `mm_adapt_import`). Additionally, one can specify the number of refinement samples to use with `refinement_samples` and the seed to use with `seed`.

The `probability_refinement` density reweighting accounts originally was developed based on Gaussian distributions. It now accounts for additional non-Gaussian cases.

7.2.55.18.1 import

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_refinement](#)
- [import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level).

7.2.55.18.2 `adapt_import`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_refinement](#)
- [adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`adapt_import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). This continues iteratively until the failure probability estimate converges.

7.2.55.18.3 `mm_adapt_import`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_refinement](#)
- [mm_adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more

probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

7.2.55.18.4 refinement_samples

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_refinement](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the `initial_samples` in a sampling design.

7.2.55.19 final_moments

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Required(Choose One)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Output standardized moments and include them within the set of final statistics.
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to `none` as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.55.19.1 none

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,  
  sampling  
    samples = 50 seed = 1234  
    response_levels = 3.6e+11 1.2e+05 3.5e+05  
    final_moments none
```

7.2.55.19.2 standard

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

7.2.55.19.3 central

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.55.20 response_levels

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_response_levels</code>	Number of values at which to estimate desired statistics for each response
	Optional		<code>compute</code>	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num-`

`_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors       = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas            = 12., 30.
  betas             = 250., 590.
  descriptors       = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs         = 3 4
  abscissas         = 5 8 10 .1 .2 .3 .4
  counts            = 17 21 0 12 24 12 0
  descriptors       = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs         = 2
  abscissas         = 3 4
  counts            = 1 1
  descriptors       = 'TF3h'

interface,
  system_async_evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

  4.5000000000e+05  0.0000000000e+00
```

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.55.20.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.55.20.2 compute

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Statistics to Compute (Group 1)	Dakota Keyword probabilities	Dakota Keyword Description Computes probabilities associated with response levels
			reliabilities	Computes reliabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels

	Optional	system	Compute system reliability (series or parallel)
--	-----------------	------------------------	---

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.55.20.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.55.20.2.2 reliabilities

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [reliabilities](#)

Computes reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `reliabilities` keyword directs Dakota to compute reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the reliabilities are not computed by default. To change this behavior, the `reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
                     3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.55.20.2.3 gen_reliabilities

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
                     3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group System Reliability Mode (Group 1)	Dakota Keyword series	Dakota Keyword Description Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.55.21 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
    1. .8 .5 0.
    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds    = 199.3, 474.63
  upper_bounds    = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas          = 12., 30.
  betas           = 250., 590.
  descriptors      = 'TF1w' 'TF2w'

2.3796737090e+05	1.0000000000e+00		
3.6997214153e+05	3.0000000000e-01		
3.8100966235e+05	2.0000000000e-01		
4.4111498127e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.55.24 `distribution`

- [Keywords Area](#)
- [method](#)

- [multifidelity_stoch_collocation](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.55.24.1 cumulative

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)

- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.55.24.2 complementary

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.55.25 variance_based_decomp

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into main, interaction, and total effects

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		interaction_order	Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

	Optional	<code>drop_tolerance</code>	Suppresses output of sensitivity indices with values lower than this tolerance
--	-----------------	-----------------------------	--

Description

Dakota can calculate sensitivity indices through variance-based decomposition using the keyword `variance_based_decomp`. This approach decomposes main, interaction, and total effects in order to identify the most important variables and combinations of variables in contributing to the variance of output quantities of interest.

Default Behavior

Because of processing overhead and output volume, `variance_based_decomp` is inactive by default, unless required for dimension-adaptive refinement using Sobol' indices.

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects, total effects, and any interaction effects will be reported. Each of these effects represents the percent contribution to the variance in the model response, where main effects include the aggregated set of *univariate* terms for each individual variable, interaction effects represent the set of *mixed* terms (the complement of the univariate set), and total effects represent the *complete* set of terms (univariate and mixed) that contain each individual variable. The aggregated set of main and interaction sensitivity indices will sum to one, whereas the sum of total effects sensitivity indices will be greater than one due to redundant counting of mixed terms.

Usage Tips

An important consideration is that the number of possible interaction terms grows exponentially with dimension and expansion order. To mitigate this, both in terms of compute time and output volume, possible interaction effects are suppressed whenever no contributions are present due to the particular form of an expansion. In addition, the `interaction_order` and `drop_tolerance` controls can further limit the computational and output requirements.

Examples

```
method,
  polynomial_chaos # or stoch_collocation
  sparse_grid_level = 3
  variance_based_decomp interaction_order = 2
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76]: "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [90].

7.2.55.25.1 `interaction_order`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)

- [variance_based_decomp](#)
- [interaction_order](#)

Specify the maximum number of variables allowed in an interaction when reporting interaction metrics.

Specification

Alias: none

Argument(s): INTEGER

Default: Unrestricted (VBD includes all interaction orders present in the expansion)

Description

The `interaction_order` option has been added to allow suppression of higher-order interactions, since the output volume (and memory and compute consumption) of these results could be extensive for high dimensional problems (note: the previous `univariate_effects` specification is equivalent to `interaction_order = 1` in the current specification). Similar to suppression of interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to again save compute and memory resources and reduce output volume)

7.2.55.25.2 `drop_tolerance`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,  
  sampling  
  sample_type lhs  
  samples = 100  
  variance_based_decomp  
  drop_tolerance = 0.001
```

7.2.55.26 diagonal_covariance

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: diagonal_covariance for response vector > 10; else full_covariance

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.55.27 full_covariance

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.55.28 import_approx_points_file

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [import_approx_points_file](#)

Filename for points at which to evaluate the PCE/SC surrogate

Specification

Alias: none

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

Default Behavior No import of points at which to evaluate the surrogate.

Expected Output The PCE/SC surrogate model will be evaluated at the list of points (input variable values) provided in the file and results tabulated and/or statistics computed at them, depending on the method context.

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_approx_points_file = 'import.mcmc_annot.dat'
    annotated
```

7.2.55.28.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)

- [import_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.55.28.2 annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [import_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.55.28.3 freeform

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [import_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009         1.1 0.0001996404857 0.2601620081 0.759955
0.89991         1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.55.28.4 active_only

- [Keywords Area](#)

- [method](#)
- [multifidelity_stoch_collocation](#)
- [import_approx_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.55.29 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.55.29.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>header</code>	Enable header row in custom-annotated tabular file
	Optional		<code>eval_id</code>	Enable evaluation ID column in custom-annotated tabular file
	Optional		<code>interface_id</code>	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76
2              0.90009      1.1 0.0001996404857  0.2601620081    0.759955

...
```

7.2.55.30 `seed_sequence`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For L levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 100 50 40 30 20
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

See Also

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.55.31 `fixed_seed`

- [Keywords Area](#)

- [method](#)
- [multifidelity_stoch_collocation](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.55.32 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [multifidelity_stoch_collocation](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'

variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system async evaluation_concurrency = 5
```

```

analysis_driver = 'text_book'

responses
response_functions = 3
no_gradients
no_hessians

```

7.2.56 sampling

- [Keywords Area](#)
- [method](#)
- [sampling](#)

Randomly samples variables according to their distributions

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)
- [sampling](#)

Specification

Alias: nond_sampling

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		samples	Number of samples for sampling-based methods
	Optional		seed	Seed of the random number generator
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional		sample_type	Selection of sampling strategy
	Optional		refinement_-samples	Performs an incremental Latin Hypercube Sampling (LHS) study

	Optional	d_optimal	Generate a D-optimal sampling design
	Optional	variance_based_decomp	Activates global sensitivity analysis based on decomposition of response variance into contributions from variables
	Optional	backfill	Ensures that the samples of discrete variables with finite support are unique
	Optional	principal_components	Activates principal components analysis of the response matrix of N samples * L responses.
	Optional	wilks	Number of samples for random sampling using Wilks statistics
	Optional	final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	reliability_levels	Specify reliability levels at which the response values will be estimated

	Optional	gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

This method generates parameter values by drawing samples from the specified uncertain variable probability distributions. The computational model is executed over all generated parameter values to compute the responses for which statistics are computed. The statistics support sensitivity analysis and uncertainty quantification.

Default Behavior

By default, `sampling` methods operate on aleatory and epistemic uncertain variables. The types of variables can be restricted or expanded (to include design or state variables) through use of the `active` keyword in the `variables` block in the Dakota input file. If continuous design and/or state variables are designated as active, the sampling algorithm will treat them as parameters with uniform probability distributions between their upper and lower bounds. Refer to [variable_support](#) for additional information on supported variable types, with and without correlation.

The following keywords change how the samples are selected:

- `sample_type`
- `fixed_seed`
- `rng`
- `samples`
- `seed`
- `variance_based_decomp`

Expected Outputs

As a default, Dakota provides correlation analyses when running LHS. Correlation tables are printed with the simple, partial, and rank correlations between inputs and outputs. These can be useful to get a quick sense of how correlated the inputs are to each other, and how correlated various outputs are to inputs. `variance_based_decomp` is used to request more sensitivity information, with additional cost.

Additional statistics can be computed from the samples using the following keywords:

- `response_levels`
- `reliability_levels`
- `probability_levels`

- `gen_reliability_levels`

`response_levels` computes statistics at the specified response value. The other three allow the specification of the statistic value, and will estimate the corresponding response value.

`distribution` is used to specify whether the statistic values are from cumulative or complementary cumulative functions.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- When `variance_based_decomp` is enabled
 - [Variance-Based Decomposition \(Sobol' Indices\)](#)
- For aleatory UQ studies
 - [Probability Density](#)
 - [Level Mappings](#)
 - [Sampling Moments](#)
 - [Correlations](#)
- For epistemic UQ studies
 - [Extreme Responses](#)
 - [Correlations](#)

Usage Tips

`sampling` is a robust approach to doing sensitivity analysis and uncertainty quantification that can be applied to any problem. It requires more simulations than newer, advanced methods. Thus, an alternative may be preferable if the simulation is computationally expensive.

Examples

```
# tested on Dakota 6.0 on 140501

environment
  tabular_data
    tabular_data_file = 'Sampling_basic.dat'

method
  sampling
  sample_type lhs
  samples = 20

model
  single

variables
  active uncertain
  uniform_uncertain = 2
  descriptors = 'input1'      'input2'
  lower_bounds = -2.0      -2.0
  upper_bounds =  2.0      2.0
  continuous_state = 1
  descriptors = 'constant1'
  initial_state = 100

interface
  analysis_drivers 'text_book'
  fork
```

```
responses
  response_functions = 1
  no_gradients
  no_hessians
```

This example illustrates a basic sampling Dakota input file.

- LHS is used instead of purely random sampling.
- The default random number generator is used.
- Without a `seed` specified, this will not be reproducible
- In the `variables` block, two types of variables are used
- Only the uncertain variables are varied, this is the default behavior, and is also specified by the `active` keyword, w/ the `uncertain` option

FAQ

Q: Do I need to keep the LHS* and S4 files? **A:** No

7.2.56.1 samples

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [samples](#)

Number of samples for sampling-based methods

Specification

Alias: `initial_samples`

Argument(s): INTEGER

Default: 0

Description

The `samples` keyword is used to define the number of samples (i.e., randomly chosen sets of variable values) at which to execute a model.

Default Behavior

By default, Dakota will use the minimum number of samples required by the chosen method.

Usage Tips

To obtain linear sensitivities or to construct a linear response surface, at least $\text{dim}+1$ samples should be used, where "dim" is the number of variables. For sensitivities to quadratic terms or quadratic response surfaces, at least $(\text{dim}+1)(\text{dim}+2)/2$ samples are needed. For uncertainty quantification, we recommend at least $10 \cdot \text{dim}$ samples. For `variance_based_decomp`, we recommend hundreds to thousands of samples. Note that for `variance_based_decomp`, the number of simulations performed will be $N \cdot (\text{dim}+2)$.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.56.2 seed

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.56.3 `fixed_seed`

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.56.4 `sample_type`

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: lhs

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Sample Type (Group 1)	lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables
			incremental_lhs	(Deprecated keyword) Augments an existing Latin Hypercube Sampling (LHS) study
			incremental_random	(Deprecated keyword) Augments an existing random sampling study

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.56.4.1 lhs

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.56.4.2 random

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.56.4.3 incremental_lhs

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [sample_type](#)
- [incremental_lhs](#)

(Deprecated keyword) Augments an existing Latin Hypercube Sampling (LHS) study

Specification

Alias: none

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

This keyword is deprecated. Instead specify `sample_type lhs` with `refinement_samples`.

7.2.56.4.4 incremental_random

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [sample_type](#)
- [incremental_random](#)

(Deprecated keyword) Augments an existing random sampling study

Specification

Alias: none

Argument(s): none

Description

This keyword is deprecated. Instead specify `sample_type random` with `refinement_samples`.

7.2.56.5 `refinement_samples`

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [refinement_samples](#)

Performs an incremental Latin Hypercube Sampling (LHS) study

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Use of `refinement_samples` replaces the deprecated `sample_type incremental_lhs` and `sample_type incremental_random`.

An incremental random sampling approach will successively add samples to an initial or existing random sampling study according to the sequence of `refinement_samples`. Dakota reports statistics (mean, variance, percentiles, etc) separately for the initial samples and for each `refinement_samples` increment at the end of the study. For an LHS design, the number of `refinement_samples` in each refinement level must result in twice the number of previous samples. For `sample_type random`, there is no constraint on the number of samples that can be added.

Often, this approach is used when you have an initial study with sample size N_1 and you want to perform an additional N_1 samples. The initial N_1 samples may be contained in a Dakota restart file so only N_1 (instead of $2 \times N_1$) potentially expensive function evaluations will be performed.

This process can be extended by repeatedly increasing (for LHS: doubling) the `refinement_samples`:

```
method
  sampling
    seed = 1337
    samples = 50
    refinement_samples = 50 100 200 400 800
```

Usage Tips

The incremental approach is useful if it is uncertain how many simulations can be completed within available time.

See the examples below and the [Usage](#) and [Restarting Dakota Studies](#) pages.

Examples

Suppose an initial study is conducted using `sample_type lhs` with `samples = 50`. A follow-on study uses a new input file where `samples = 50`, and `refinement_samples = 50`, resulting in 50 reused samples (from restart) and 50 new random samples. The 50 new samples will be combined with the 50 previous samples to generate a combined sample of size 100 for the analysis.

One way to ensure the restart file is saved is to specify a non-default name, via a command line option:

```
dakota -input LHS_50.in -write_restart LHS_50.rst
```

which uses the input file:

```
# LHS_50.in

environment
  tabular_data
    tabular_data_file = 'LHS_50.dat'

method
  sampling
    seed = 1337
    sample_type lhs
    samples = 50

model
  single

variables
  uniform_uncertain = 2
  descriptors = 'input1' 'input2'
  lower_bounds = -2.0 -2.0
  upper_bounds = 2.0 2.0

interface
  analysis_drivers 'text_book'
  fork

responses
  response_functions = 1
  no_gradients
  no_hessians
```

and the restart file is written to LHS_50.rst.

Then an incremental LHS study can be run with:

```
dakota -input LHS_100.in -read_restart LHS_50.rst -write_restart LHS_100.rst
```

where LHS_100.in is shown below, and LHS_50.rst is the restart file containing the results of the previous LHS study. In the example input files for the initial and incremental studies, the values for `seed` match. This ensures that the initial 50 samples generated in both runs are the same.

```
# LHS_100.in

environment
  tabular_data
    tabular_data_file = 'LHS_100.dat'

method
  sampling
    seed = 1337
    sample_type lhs
    samples = 50
    refinement_samples = 50

model
  single

variables
  uniform_uncertain = 2
  descriptors = 'input1' 'input2'
  lower_bounds = -2.0 -2.0
  upper_bounds = 2.0 2.0

interface
  analysis_drivers 'text_book'
  fork

responses
```

```

response_functions = 1
no_gradients
no_hessians

```

The user will get 50 new LHS samples which maintain both the correlation and stratification of the original LHS sample. The new samples will be combined with the original samples to generate a combined sample of size 100.

7.2.56.6 d_optimal

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [d_optimal](#)

Generate a D-optimal sampling design

Specification

Alias: none

Argument(s): none

Default: off

Child Keywords:

	Required/Optional Optional (<i>Choose One</i>)	Description of Group Design Strategy (Group 1)	Dakota Keyword candidate_designs	Dakota Keyword Description Number of candidate sampling designs from which to select the most D-optimal
			leja_oversample_ratio	Oversampling ratio for generating candidate point set

Description

This option will generate a sampling design that is approximately determinant-optimal (D-optimal) by downselecting from a set of candidate sample points.

Default Behavior

If not specified, a standard sampling design (MC or LHS) will be generated. When `d_optimal` is specified, 100 candidate designs will be generated and the most D-optimal will be selected.

Usage Tips

D-optimal designs are only supported for [aleatory_uncertain_variables](#). The default candidate-based D-optimal strategy works for all submethods except incremental LHS (`lhs` with `refinement_samples`). The Leja sampling option only works for continuous variables, and when used with LHS designs, the candidates point set will be Latin, but the final design will not be.

Examples

```
method
  sampling
    sample_type random
    samples = 20
    d_optimal
```

7.2.56.6.1 candidate_designs

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [d_optimal](#)
- [candidate_designs](#)

Number of candidate sampling designs from which to select the most D-optimal

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

Dakota will generate `candidate_designs` using the specified sampling strategy and select the one that is more determinant-optimal (D-optimal)

Examples

```
method
  sampling
    sample_type random
    samples = 20
    d_optimal
    candidate_designs = 500
```

7.2.56.6.2 leja_oversample_ratio

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [d_optimal](#)
- [leja_oversample_ratio](#)

Oversampling ratio for generating candidate point set

Specification

Alias: none

Argument(s): REAL

Default: 10.0

Description

When generating a D-Optimal point set of size N, the `oversample_ratio` R controls the number of candidate points R x N from which the D-Optimal points are chosen.

Default Behavior

The default when not specified is to perform candidate-based sample design selection (non-Leja)

Examples

```
method
  sampling
    sample_type random
    samples = 20
    d_optimal
      oversample_ratio = 2.0
```

7.2.56.7 variance_based_decomp

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [variance_based_decomp](#)

Activates global sensitivity analysis based on decomposition of response variance into contributions from variables

Specification

Alias: none

Argument(s): none

Default: no variance-based decomposition

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		drop_tolerance	Suppresses output of sensitivity indices with values lower than this tolerance

Description

Dakota can calculate sensitivity indices through variance based decomposition using the keyword `variance_based_decomp`. These indicate how important the uncertainty in each input variable is in contributing to the output variance.

Default Behavior

Because of the computational cost, `variance_based_decomp` is turned off as a default.

If the user specified a number of samples, N, and a number of nondeterministic variables, M, variance-based decomposition requires the evaluation of $N*(M+2)$ samples. **Note that specifying this keyword will increase the number of function evaluations above the number requested with the `samples` keyword since replicated sets of sample values are evaluated.**

Expected Outputs

When `variance_based_decomp` is specified, sensitivity indices for main effects and total effects will be reported. Main effects (roughly) represent the percent contribution of each individual variable to the variance in the model response. Total effects represent the percent contribution of each individual variable in combination with all other variables to the variance in the model response

Usage Tips

To obtain sensitivity indices that are reasonably accurate, we recommend that N, the number of samples, be at least one hundred and preferably several hundred or thousands.

Examples

```
method,
  sampling
  sample_type lhs
  samples = 100
  variance_based_decomp
```

Theory

In this context, we take sensitivity analysis to be global, not local as when calculating derivatives of output variables with respect to input variables. Our definition is similar to that of [76] : "The study of how uncertainty in the output of a model can be apportioned to different sources of uncertainty in the model input."

Variance based decomposition is a way of using sets of samples to understand how the variance of the output behaves, with respect to each input variable. A larger value of the sensitivity index, S_i , means that the uncertainty in the input variable i has a larger effect on the variance of the output. More details on the calculations and interpretation of the sensitivity indices can be found in [76] and [90].

7.2.56.7.1 `drop_tolerance`

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [variance_based_decomp](#)
- [drop_tolerance](#)

Suppresses output of sensitivity indices with values lower than this tolerance

Specification

Alias: none

Argument(s): REAL

Default: All VBD indices displayed

Description

The `drop_tolerance` keyword allows the user to specify a value below which sensitivity indices generated by `variance_based_decomp` are not displayed.

Default Behavior

By default, all sensitivity indices generated by `variance_based_decomp` are displayed.

Usage Tips

For `polynomial_chaos`, which outputs main, interaction, and total effects by default, the `univariate_effects` may be a more appropriate option. It allows suppression of the interaction effects since the output volume of these results can be prohibitive for high dimensional problems. Similar to suppression of these interactions is the covariance control, which can be selected to be `diagonal_covariance` or `full_covariance`, with the former supporting suppression of the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

Examples

```
method,
  sampling
  sample_type lhs
  samples = 100
  variance_based_decomp
  drop_tolerance = 0.001
```

7.2.56.8 backfill

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [backfill](#)

Ensures that the samples of discrete variables with finite support are unique

Specification

Alias: none

Argument(s): none

Description

Traditional LHS can generate replicate samples when applied to discrete variables. This keyword enforces uniqueness, which is determined only over the set of discrete variables with finite support. This allows one to generate LHS for a mixed set of continuous and discrete variables whilst still enforcing that the set of discrete LHS components of all the samples are unique.

Default Behavior

Uniqueness of samples over discrete variables is not enforced.

Usage Tips

Uniqueness can be useful when applying discrete LHS to simulations without noise.

Examples

```
method,
  sampling
    samples = 12
    seed = 123456
    sample_type lhs backfill

variables,
  active all
  uniform_uncertain = 1
  lower_bounds = 0.
  upper_bounds = 1.
  descriptors = 'continuous-uniform'

  discrete_uncertain_set
    integer = 1
    elements_per_variable = 4
    elements 1 3 5 7
    descriptors = 'design-set-int'
    real = 1
    initial_point = 0.50
    set_values = 0.25 0.50 0.75 1.00
    descriptors = 'design-set-real'

interface,
  direct analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

These keywords may also be of interest:

- [lhs](#)

7.2.56.9 principal_components

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [principal_components](#)

Activates principal components analysis of the response matrix of N samples * L responses.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>percent_variance_explained</code>	Specifies the number of components to retain to explain the specified percent variance.

Description

Dakota can calculate the principal components of the response matrix of N samples * L responses using the keyword `principal_components`. Principal components analysis (PCA) is a data reduction method. The Dakota implementation is under active development: the PCA capability may ultimately be specified elsewhere or used in different ways. For now, it is performed as a post-processing analysis based on a set of Latin Hypercube samples.

We now have field responses in Dakota. PCA is an initial approach in Dakota to analyze and represent the field data. Specifically, if we have a sample ensemble of field data responses, we want to identify the principal components responsible for the spread of that data. Then, we can generate a surrogate model by representing the overall response as weighted sum of M principal components, where the weights will be determined by GPs which are a function of the input uncertain variables. This reduced form then can be used for sensitivity analysis, calibration, etc.

The steps involved when one specifies `principal_components` in Dakota are as follows:

- Create an LHS input sample based on the uncertain variable specification and run the user-specified model at the LHS points to compute the field responses. For notation purposes, there are d input parameters, N samples, and the field length is L .
- Perform PCA on the covariance matrix of the data set from the previous step. This is done by first centering the data (e.g. subtracting the mean of each column from that column) and performing a singular value decomposition on the covariance matrix of the centered data. The eigenvectors of the covariance matrix correspond to the principal components.
- Identify M principal components based on the percentage of variance explained. There is an optional keyword for `principal_components` called `percent_variance_explained`, which is a threshold that determines the number of components that are retained to explain at least that amount of variance. For example, if the user specifies `percent_variance_explained = 0.99`, the number of components that accounts for at least 99 percent of the variance in the responses will be retained. The default for this percentage is 0.95. In many applications, only a few principal components explain the majority of the variance, resulting in significant data reduction.
- Use the principal components in a predictive sense, by constructing a prediction approximation. The basis functions for this approximation are the principal components. The coefficients of the bases are obtained by constructing GP surrogates for the factor scores of the M principal components. The GP surrogates will be functions of the uncertain inputs. The idea is that we have just performed PCA on (for example) the covariance matrix of 100 samples. Typically, those 100 samples will be generated by sampling over some d uncertain input parameters denoted by u , so there should be a mapping from u to the field data, specifically to the loading coefficients and the factor scores. Currently, the final item printed from a Principal Components Analysis in Dakota is a set of prediction samples based on this prediction approximation or surrogate model that relies on the principal components.

Default Behavior

`principal_components` is turned off as a default. It may be used with either scalar responses or field responses, but it is intended to be used with large field responses as a data reduction method. For example, typically we expect the number of LHS samples, N , to be less than the number of field responses, L (e.g. if there is one field, the number of responses values is the length of that field).

Expected Outputs

When `principal_components` is specified, the number of significant principal components is printed along with the predictions based on the principal components. If `output debug` is specified, additional information is printed, including the original response matrix, the centered data, the principal components, and the factor scores.

Usage Tips

This is a preliminary capability that is undergoing active development. Please contact the Dakota developers team if you have problems with using this capability or want to suggest additional features.

Examples

```
method,
  sampling
  sample_type lhs
  samples = 100
  principal_components
  percent_variance_explained = 0.98
```

Theory

There is an extensive statistical literature available on PCA. We recommend that the interested user peruse some of this in using the PCA capability.

7.2.56.9.1 percent_variance_explained

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [principal_components](#)
- [percent_variance_explained](#)

Specifies the number of components to retain to explain the specified percent variance.

Specification

Alias: none

Argument(s): REAL

Description

Dakota can calculate the principal components of the response matrix of N samples * L responses using the keyword `principal_components`. Principal components analysis (PCA) is a data reduction method. `percent_variance_explained` is a threshold that determines the number of components that are retained to explain at least that amount of variance. For example, if the user specifies `percent_variance_explained = 0.99`, the number of components that accounts for at least 99 percent of the variance in the responses will be retained. The default for this percentage is 0.95. In many applications, only a few principal components explain the majority of the variance, resulting in significant data reduction.

Expected Outputs

Usage Tips `percent_variance_explained` should be a real number between 0.0 and 1.0. Typically, it will be between 0.9 and 1.0.

Examples

```
method,
  sampling
  sample_type lhs
  samples = 100
  principal_components
  percent_variance_explained = 0.98
```

Theory

There is an extensive statistical literature available on PCA. We recommend that the interested user peruse some of this in using the PCA capability.

7.2.56.10 wilks

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [wilks](#)

Number of samples for random sampling using Wilks statistics

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		order	The order of the statistics to use when determining sample sizes for random sampling using Wilks order statistics.
	Optional		confidence_level	The confidence level to be used when determining sample sizes for random sampling using Wilks order statistics.

	Optional	<code>one_sided_lower</code>	Specifies one-sided lower portion order statistics to be used when determining sample sizes for random sampling using Wilks order statistics.
	Optional	<code>one_sided_upper</code>	Specifies one-sided upper portion order statistics to be used when determining sample sizes for random sampling using Wilks order statistics.
	Optional	<code>two_sided</code>	Specifies two-sided order statistics (an interval) to be used when determining sample sizes for random sampling using Wilks order statistics.

Description

The `wilks` keyword is used to compute the number of samples to execute for a random sampling study using Wilks statistics [91] and [68]. In contrast to most sampling studies where the user specifies the number of samples in advance, Wilks determines the number of samples to run to achieve a particular objective. Specifically, Wilks statistics specify a probability level, alpha, and confidence level, beta, and determines the minimum number of samples required such that there is beta% confidence that the alpha*100 percentile of the uncertain distribution on model output will fall below the actual alpha*100 percentile given by the sample when outputs are ordered from smallest to largest. Statistics can also be either `one_side` or `two_sided` with the former reflecting a statement about uppermost sample output and the latter reflecting both the smallest and largest sample outputs. Finally, the order of the statistics can be increased to higher order such that the statement concerning probability level and confidence level applies to the uppermost M outputs (for one-sided M-order Wilks) or the lowest M and uppermost M outputs (for two-sided M-order Wilks).

Default Behavior

By default, Wilks statistics are computed using one-sided first-order order statistics with a 95% confidence interval (beta) and 95% probability (alpha). This results in a sample size of 59.

Usage Tips

Wilks sample sizes apply to model outputs considered one-at-a-time. Joint variation among multiple outputs requires a generalization of the Wilks approach and is not supported in Dakota at this time.

When more than one probability level is specified, the largest sample size will be performed and used to subsample for the lower probability levels.

Examples

```
method
  sampling
    sample_type random
```

```
wilks
  probability_levels = 0.75 0.8 0.95 0.99
  confidence_level 0.99
  two_sided
  order 2
```

7.2.56.10.1 order

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [wilks](#)
- [order](#)

The order of the statistics to use when determining sample sizes for random sampling using Wilks order statistics.

Specification

Alias: none

Argument(s): INTEGER

Description

Default Behavior

The default order is 1.

Examples

```
method
  sampling
  sample_type random
  wilks
  order 2
```

- [method](#)
- [sampling](#)
- [wilks](#)
- [two_sided](#)

Specifies two-sided order statistics (an interval) to be used when determining sample sizes for random sampling using Wilks order statistics.

Specification

Alias: none

Argument(s): none

Description

This option causes the sample size to be based on the interval defined by the lowest N and uppermost N outputs for order N statistics (default N=1).

Default Behavior The default for Wilks is `one_sided_upper`.

Examples

```
method
  sampling
    sample_type random
  wilks
    two_sided
```

These keywords may also be of interest:

- [wilks](#)

7.2.56.11 final_moments

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.

			<code>standard</code>	Output standardized moments and include them within the set of final statistics.
			<code>central</code>	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to `none` as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.56.11.1 none

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,  
  sampling  
    samples = 50 seed = 1234  
    response_levels = 3.6e+11 1.2e+05 3.5e+05  
    final_moments none
```

7.2.56.11.2 standard

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

7.2.56.11.3 central

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.56.12 response_levels

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_response_levels</code>	Number of values at which to estimate desired statistics for each response
	Optional		<code>compute</code>	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num-`

`_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds     = 199.3, 474.63
  upper_bounds     = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas           = 12., 30.
  betas            = 250., 590.
  descriptors      = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs        = 3 4
  abscissas        = 5 8 10 .1 .2 .3 .4

  4.5000000000e+05  0.0000000000e+00
```

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.56.12.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.56.12.2 compute

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Statistics to Compute (Group 1)	Dakota Keyword probabilities	Dakota Keyword Description Computes probabilities associated with response levels
			reliabilities	Computes reliabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels

	Optional	system	Compute system reliability (series or parallel)
--	-----------------	------------------------	---

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.56.12.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.56.12.2.2 reliabilities

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)
- [reliabilities](#)

Computes reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `reliabilities` keyword directs Dakota to compute reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the reliabilities are not computed by default. To change this behavior, the `reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                      6.0e+04 6.5e+04 7.0e+04
                      3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.56.12.2.3 gen_reliabilities

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                      6.0e+04 6.5e+04 7.0e+04
                      3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.56.12.2.4 system

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group System Reliability Mode (Group 1)	Dakota Keyword series	Dakota Keyword Description Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.56.12.2.5 series

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [series](#)

Aggregate response statistics assuming a series system

Specification

Description

See parent keyword `system` for description.

7.2.56.13 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_probability_levels</code>	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
    1. .8 .5 0.
    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds     = 199.3, 474.63
  upper_bounds     = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas           = 12., 30.
  betas            = 250., 590.
  descriptors      = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs        = 3 4

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.56.16 `distribution`

- [Keywords Area](#)
- [method](#)

- [sampling](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.56.16.1 cumulative

- [Keywords Area](#)
- [method](#)
- [sampling](#)

- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.56.16.2 complementary

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.56.17 rng

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword	Dakota Keyword Description
			mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.56.17.1 mt19937

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.56.17.2 rnum2

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.56.18 model_pointer

- [Keywords Area](#)
- [method](#)
- [sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which `model` block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a `model` block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,

- [method](#)
- [multilevel_sampling](#)

Multilevel sampling methods for UQ

Specification

Alias: multilevel_mc mlmc

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional		pilot_samples	Initial set of samples for multilevel sampling methods.
	Optional		solution_mode	Solution mode for multi-level/multifidelity methods
	Optional		sample_type	Selection of sampling strategy
	Optional		export_sample_sequence	Enable export of multi-level/multifidelity sample sequences to individual files

	Optional	allocation_target	Allocation statistics/target for the MLMC sample allocation.
	Optional	qoi_aggregation	Aggregation strategy for the Qols statistics for problems with multiple responses in the MLMC algorithm
	Optional	convergence_tolerance	Stopping criterion based on relative error
	Optional	convergence_tolerance_type	Sets the type of the convergence tolerance. Can be absolute or relative. Default Behavior "relative"
	Optional	convergence_tolerance_target	Sets the target of the MLMC sample allocation, i.e. the constraint of the MLMC sample allocation problem Default Behavior "variance_constraint"
	Optional	max_iterations	Stopping criterion based on number of refinement iterations within the multilevel sample allocation
	Optional	max_function_evaluations	Stopping criterion based on maximum function evaluations
	Optional	final_statistics	Indicate the type of final statistics to be returned by a UQ method

	Optional	<code>rng</code>	Selection of a random number generator
	Optional	<code>model_pointer</code>	Identifier for model block to be used by a method

Description

An adaptive sampling method that utilizes multilevel relationships within a hierarchical surrogate model in order to improve efficiency through variance reduction.

In the case of a multilevel relationship, multilevel Monte Carlo methods are used to compute an optimal sample allocation per level.

Multilevel Monte Carlo

The Monte Carlo estimator for the mean is defined as

$$\mathbb{E}[Q] \equiv \hat{Q}^{MC} = \frac{1}{N} \sum_{i=1}^N Q^{(i)}$$

In a multilevel method with L levels, we replace this estimator with a telescoping sum:

$$\mathbb{E}[Q] \equiv \hat{Q}^{ML} = \sum_{l=0}^L \frac{1}{N_l} \sum_{i=1}^{N_l} (Q_l^{(i)} - Q_{l-1}^{(i)}) \equiv \sum_{l=0}^L \hat{Y}_l^{MC}$$

This decomposition forms discrepancies for each level greater than 0, seeking reduction in the variance of the discrepancy Y relative to the variance of the original response Q . The number of samples allocated for each level (N_l) is based on a total cost minimization procedure that incorporates the relative cost and observed variance for each of the Y_l .

Default Behavior

The `multilevel_sampling` method employs Monte Carlo sample sets by default, but this default can be overridden to use Latin hypercube sample sets using `sample_type lhs`.

Expected Output

The `multilevel_sampling` method reports estimates of the first four moments and a summary of the evaluations performed for each model fidelity and discretization level. The method does not support any level mappings (response, probability, reliability, generalized reliability) at this time.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Sampling Moments](#) (moments only, not confidence intervals)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Usage Tips

The multilevel sampling method must be used in combination with a hierarchical model specification, and supports either a sequence of model forms or a sequence of discretization levels. For the former, each model form must provide a scalar `solution_level_cost` and for the latter, it is necessary to identify the variable string descriptor that controls the resolution levels using `solution_level_control` as well as the associated array of relative costs using `solution_level_cost`.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  max_iterations = 10
  convergence_tolerance = .001
```

specifies a multilevel Monte Carlo study in combination with the model identified by the HIERARCH pointer. This model specification provides a one-dimensional hierarchy, typically defined by a single model fidelity with multiple discretization levels, but may also be provided as multiple ordered model fidelities, each with a single (or default) discretization level. An example of the former (single model fidelity with multiple discretization levels) follows:

```
model,
  id_model = 'HIERARCH'
  surrogate hierarchical
  ordered_model_fidelities = 'SIM1'
  correction additive zeroth_order

model,
  id_model = 'SIM1'
  simulation
  solution_level_control = 'N_x'
  solution_level_cost = 630. 1260. 2100. 4200.
```

Refer to `dakota/test/dakota_uq*_mlmc.in` in the source distribution for additional examples.

7.2.57.1 seed_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For $\$L\$$ levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 100 50 40 30 20
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

See Also

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.57.2 fixed_seed

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.57.3 pilot_samples

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [pilot_samples](#)

Initial set of samples for multilevel sampling methods.

Specification

Alias: `initial_samples`

Argument(s): INTEGERLIST

Description

The pilot sample provides initial estimates of variance and/or correlation within the first iteration of a multilevel and/or control variate approach.

Default Behavior

100 samples per model fidelity and/or discretization level.

Usage Tips

The number of specified values can be none (default values used for all fidelities and levels), one (all fidelities and levels use the same specified value), the number of discretization levels for every model (each model uses the

same discretization level profile), or the aggregate number of discretization levels for all models (samples for each discretization level are distinct for each model).

7.2.57.4 solution_mode

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [solution_mode](#)

Solution mode for multilevel/multifidelity methods

Specification

Alias: none

Argument(s): none

Default: online pilot

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Ensemble Sampling Solution Mode (Group 1)	online_pilot	Specify a solution mode that includes the pilot cost within the sample allocation logic
			offline_pilot	Specify a solution mode that excludes the pilot cost from sample allocation logic
			pilot_projection	Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. The pilot sample can be integrated according to one of three solution modes:

- `online_pilot`: include pilot sample cost within sample allocation (default)
- `offline_pilot`: treat pilot cost as offline and exclude from sample allocation

- `pilot_projection`: only perform the pilot sample and only estimate the expected performance based on a projection of the pilot statistics (useful for method selection)

Default Behavior Online pilot

7.2.57.4.1 `online_pilot`

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [solution_mode](#)
- [online_pilot](#)

Specify a solution mode that includes the pilot cost within the sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as online cost and is included within the optimal sample allocation logic. This mode is the default.

Additional Discussion It is typically advantageous to start from a smaller pilot sample and then rely on the adaptive logic to increase the sample levels to the optimal level required to achieve the desired accuracy or enforce the prescribed budget. Over-estimation of the pilot, while supporting more robust estimation of correlations and variances, can hide the optimal profile and result in a non-optimal allocation of resources.

7.2.57.4.2 `offline_pilot`

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [solution_mode](#)
- [offline_pilot](#)

Specify a solution mode that excludes the pilot cost from sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as offline cost and is excluded from the optimal sample allocation logic. This mode is typically used for generating reference performance using an "oracle" approach, i.e., specifying a large pilot sample in order to obtain best-case correlation or variance estimates prior to generating a sample profile.

7.2.57.4.3 pilot_projection

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [solution_mode](#)
- [pilot_projection](#)

Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, evaluations are limited to the pilot sample and these initial estimates are used to project the potential performance under the assumption that these estimates are accurate.

This mode is useful for comparing the projected performance of different estimators, which can inform method selection.

7.2.57.5 sample_type

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Sample Type (Group 1)	lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.57.5.1 lhs

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.57.5.2 random

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.57.6 export_sample_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [export_sample_sequence](#)

Enable export of multilevel/multifidelity sample sequences to individual files

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Optional (<i>Choose One</i>)	Description of Group Tabular Format (Group 1)	Dakota Keyword custom_annotated	Dakota Keyword Description Export sample sequences enabling file format customization
			annotated	Export sample sequences with descriptors
			freeform	Export sample sequences without heading descriptors

Description

When this option is active, separate output files are written for each unique sample increment and are tagged by algorithm type, simulation interface, iteration count, level count, and the number of samples as described below. The data content is comprised of the input variables only, without corresponding responses, as an intended use case is to support evaluation of these sample sets offline.

Default Behavior

If not specified, the `annotated` format is assumed.

Expected Output

Separate output files are generated according to the following format: `{ml/cv}_{interface_id}_{iteration_number}_{level_number}_{number_of_samples}.dat`.

With respect to the algorithm type, interface id, and level counter, the following definitions are employed:

- Multilevel MC with hierarchical model: `ml_` is pre-pended for all sample increments and sample sets are tagged with the interface id from the HF model.
- Control Variate MC with hierarchical model (deprecated): `cv_` is prepended for all sample increments, shared sample sets are tagged with the HF interface id, and LF-only refinements are tagged by the LF interface id.
- Multilevel-Control Variate MC with hierarchical model: employs a combination of exports from the two cases above. `ml_` is pre-pended for all HF sample increments and sample sets are tagged with the interface id from

the HF model; `cv_` is prepended for all LF increments and sample sets are tagged with the LF interface id. Note that the LF model shares the same `m1_` sample sets, but a redundant file is not created for this data.

- Non-hierarchical approaches (Multifidelity MC, Approximate Control Variate): `cv_` is prepended for all sample increments and sample sets are tagged with the corresponding model interface id. The level number corresponds to the index of the approximation model for LF increments and to the id of the truth model (number of LF approximations + 1) for shared increments.

With respect to iteration count, pilot samples are tagged with iteration 0.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  output_silent
  export_sample_sequence
```

results in enabling the sample output of sample increments for each level to individual files using the default annotated format.

The following variables block

```
variables,
  id_variables = 'LF_VARS'
  uniform_uncertain = 7
  lower_bounds = 7*-1.
  upper_bounds = 7* 1.
  descriptors 'u1' 'u2' 'u3' 'u4' 'u5' 'u6' 'u7'
  discrete_state_set
  integer = 2
  num_set_values = 4 1
  set_values = 5 15 30 60 # number of spatial coords
               3         # number of Fourier solution modes
  initial_state = 5 3
  descriptors 'N_x' 'N_mod'
```

illustrates how to define descriptors for the variables. For this case, the descriptors `u1` through `u7`, `N_x`, and `N_mod` are reported in the sample files to help annotate the data.

7.2.57.6.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [export_sample_sequence](#)
- [custom_annotated](#)

Export sample sequences enabling file format customization

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

Sample sequences are written on file with a user-defined format. If the keyword `header` is present the heading is used, if the keyword `eval_id` is present the sample number (per level) is included and if `interface_id` is provided then the interface identification is reported.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  output silent
  export_sample_sequence custom_annotated eval_id
```

results in enabling the sample output on file with a customized format including only the progressive number of the sample (`eval_id`).

7.2.57.6.2 annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [export_sample_sequence](#)
- [annotated](#)

Export sample sequences with descriptors

Specification

Alias: none

Argument(s): none

Default: annotated

Description

Sample sequences are written on file using header descriptors for the data set and a per-level progressive number, `eval_id`. The interface identifier, `interface_id`, is also reported as well as the model descriptors.

7.2.57.6.3 freeform

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [export_sample_sequence](#)
- [freeform](#)

Export sample sequences without heading descriptors

Specification

Alias: none

Argument(s): none

Default: annotated

Description

Sample sequences are written on file without using any heading descriptors for the data set. The interface identifier, `interface_id`, and the model descriptors are still reported.

7.2.57.7 allocation_target

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)

Allocation statistics/target for the MLMC sample allocation.

Specification

Alias: none

Argument(s): none

Default: mean

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Allocation target (Group 1)	mean	Fit MLMC sample allocation to control the variance of the estimator for the mean.
			variance	Fit MLMC sample allocation to control the variance of the estimator for the variance.
			standard_deviation	Fit MLMC sample allocation to control the variance of the estimator for the standard deviation.
			scalarization	Fit MLMC sample allocation to a mixture of terms of means and standard deviations.

Description

Computes the variance of the estimator for a given statistics/target and fits sample allocation by solving the corresponding optimization problem. The `allocation_target` specification supports options of `mean` (default), `variance` an analytic approximation is available. Additionally, a numerical optimization can be used in that case, see `variance` option [optimization](#).

Default Behavior "mean"

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = variance
```

uses the variance as sample allocation target by computing its variance.

7.2.57.7.1 mean

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)
- [mean](#)

Fit MLMC sample allocation to control the variance of the estimator for the mean.

Specification

Alias: none

Argument(s): none

Description

Computes the variance of the mean estimator and fits sample allocation by solving the corresponding optimization problem. This optimization problem is solved in analytically closed form.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = mean
```

uses the mean as sample allocation target by computing its variance.

7.2.57.7.2 variance

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)
- [variance](#)

Fit MLMC sample allocation to control the variance of the estimator for the variance.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		optimization	Solve the optimization problem for the sample allocation by numerical optimization in the case of sampling estimator targeting the variance.

Description

Computes the variance of the sampling estimator for the variance and fits sample allocation by solving the corresponding optimization problem. This optimization problem is obtained in closed form with an analytical approximation. Additionally, a numerical optimization can be used in that case, see [optimization](#).

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = variance
```

uses the variance as sample allocation target by computing its variance.

Theory

A single level unbiased estimator for the variance of a generic QoI at the highest level M_L of the hierarchy can be written as

$$\text{Var}[Q_{M_L}] \approx \frac{1}{N_{M_L} - 1} \sum_{i=1}^{N_{M_L}} \left(Q_{M_L}^{(i)} - \mathbb{E}[Q_L] \right)^2.$$

The multilevel extension for this estimator is obtained by writing

$$\text{Var}[Q_L] \approx \hat{Q}_{L,2}^{\text{ML}} = \sum_{\ell=0}^L \hat{Q}_{\ell,2} - \hat{Q}_{\ell-1,2},$$

where

$$\hat{Q}_{\ell,2} = \frac{1}{N_{\ell} - 1} \sum_{i=1}^{N_{\ell}} \left(Q_{\ell}^{(i)} - \hat{Q}_{\ell} \right)^2 \quad \text{and} \quad \hat{Q}_{\ell-1,2} = \frac{1}{N_{\ell-1} - 1} \sum_{i=1}^{N_{\ell-1}} \left(Q_{\ell-1}^{(i)} - \hat{Q}_{\ell-1} \right)^2.$$

As for the expected value case, we want to obtain an optimal sample allocation per level that minimizes the cost to obtain an estimator with a prescribed variance. The variance of the multilevel estimator $\hat{Q}_{L,2}^{\text{ML}}$ can be written as

$$\text{Var} [\hat{Q}_{\ell,2}] \approx \frac{1}{N_\ell} \left(\hat{Q}_{\ell,4} - \frac{N_\ell - 3}{N_\ell - 1} (\hat{Q}_{\ell,2})^2 \right),$$

where $\hat{Q}_{\ell,4}$ denotes the sampling estimator for the fourth order central moment. For more details about the expression that each single term takes in the previous expression, please refer to the Theory Manual.

The final sample allocation is obtained by solving a minimization problem

$$\min_{N_\ell} \sum_{\ell=0}^L \mathcal{C}_\ell N_\ell \quad \text{s.t.} \quad \text{Var} [\hat{Q}_{L,2}^{\text{ML}}] = \varepsilon^2/2.$$

This optimization problem can be solved in two different ways, namely an analytical approximation and by solving a non-linear optimization problem. The analytical approximation follows the approach described in [Pisaroni2017] and introduces a helper variable

$$\hat{V}_{2,\ell} := \text{Var} [\hat{Q}_{\ell,2}] \cdot N_\ell,$$

and the minimization problem is formulated as

$$f(N_\ell, \lambda) = \sum_{\ell=0}^L N_\ell \mathcal{C}_\ell + \lambda \left(\sum_{\ell=0}^L N_\ell^{-1} \hat{V}_{2,\ell} - \varepsilon^2/2 \right).$$

This formulation has a closed form solution (similarly to the expected value case)

$$N_\ell = \frac{2}{\varepsilon^2} \left[\sum_{k=0}^L (\hat{V}_{2,k} \mathcal{C}_k)^{1/2} \right] \sqrt{\frac{\hat{V}_{2,\ell}}{\mathcal{C}_\ell}}.$$

If the option [optimization](#) is specified the previous optimization problem is solved numerically via either OPTPP (default choice) or NPSOL (if available).

Solve the optimization problem for the sample allocation by numerical optimization in the case of sampling estimator targeting the variance.

Specification

Alias: none

Argument(s): none

Description

Employ numerical optimization to solve the optimization problem for finding the optimal sample allocation when targeting the variance. This option needs NPSOL (preferred choice) or OPTPP (alternative choice) installed.

Default Behavior "off"

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = variance
  optimization
```

uses the variance as sample allocation target and solves the resulting optimization problem using numerical optimization.

7.2.57.7.3 standard_deviation

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)
- [standard_deviation](#)

Fit MLMC sample allocation to control the variance of the estimator for the standard deviation.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		optimization	Solve the optimization problem for the sample allocation by numerical optimization in the case of sampling estimator targeting the standard_deviation.

Description

Computes the variance of the sampling estimator for the standard_deviation and fits sample allocation by solving the corresponding optimization problem.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = standard_deviation
```

uses the `standard_deviation` as sample allocation target by computing its variance.

See Also

These keywords may also be of interest:

- [variance](#)

7.2.57.7.3.1 optimization

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)
- [standard_deviation](#)
- [optimization](#)

Solve the optimization problem for the sample allocation by numerical optimization in the case of sampling estimator targeting the `standard_deviation`.

Specification

Alias: none

Argument(s): none

Description

Employ numerical optimization to solve the optimization problem for finding the optimal sample allocation when targeting the standard deviation. This option needs NPSOL (preferred choice) or OPTPP (alternative choice) installed.

Default Behavior "off"

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = standard_deviation
  optimization
```

uses the standard deviation as sample allocation target and solves the resulting optimization problem using numerical optimization.

7.2.57.7.4 scalarization

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [allocation_target](#)
- [scalarization](#)

Fit MLMC sample allocation to a mixture of terms of means and standard deviations.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		scalarization_	
	Optional		response_mapping	
	Optional		optimization	Solve the optimization problem for the sample allocation by numerical optimization in the case of sampling estimator targeting the scalarization.

Description

Fit MLMC sample allocation to control the variance of the estimator for a mixture of terms of means and standard deviations. The exact scalarized formulation is given by the keyword `scalarization_response_mapping`.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = scalarization
  scalarization_response_mapping = 1 0 0 0
                                0 0 1 3
```

uses the `standard_deviation` as sample allocation target by computing its variance. In this example, we assume a problem with two responses where the first line in `scalarization_response_mapping` refers to the first response, the second line to the second response. In the first line we only use 1 times the mean as quantity of interest. For the second response, we use 1 time the mean plus 3 times the standard deviation of the second quantity of interest. This behavior mimics the keywords [primary_response_mapping](#) and [secondary_response_mapping](#).

7.2.57.8 qoi_aggregation

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [qoi_aggregation](#)

Aggregation strategy for the Qols statistics for problems with multiple responses in the MLMC algorithm

Specification

Alias: none

Argument(s): none

Default: sum

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Qoi Aggregation (Group 1)	sum	Aggregate the variances over all Qols to generate a target for each level in a MLMC algorithm.
			max	Compute sample allocation for each response and use maximum over responses for each level in a MLMC algorithm

Description

In the multilevel method a variance of the `allocation_target` is computed for each of the responses and their levels $Y_\ell^i, i = 1, \dots, R, \ell = 0, \dots, L$. Setting `qoi_aggregation` describes the rule on how to aggregate those variances over multiple response functions. Supported options are `sum` (default) and `max`. For `sum`, the variances are aggregated and a single sample allocation is computed. For `max`, an individual sample allocation for each response using the respective variances over levels is computed and the maximum over all responses for each level is taken (worst case scenario allocation).

Default Behavior "sum"

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = mean
  qoi_aggregation = sum
```

uses the sum rule to aggregate the variance over the qois.

7.2.57.8.1 sum

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [qoi_aggregation](#)
- [sum](#)

Aggregate the variances over all Qols to generate a target for each level in a MLMC algorithm.

Specification

Alias: none

Argument(s): none

Description

The variances of the `allocation_target` of $Y_\ell^i, i = 1, \dots, R$ are aggregated and a single sample allocation is computed.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = mean
  qoi_aggregation = sum
```

uses the sum rule to aggregate the variance over the qois.

7.2.57.8.2 max

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [qoi_aggregation](#)
- [max](#)

Compute sample allocation for each response and use maximum over responses for each level in a MLMC algorithm

Specification

Alias: none

Argument(s): none

Description

An individual sample allocation for each response using the respective variances of the `allocation_target` of Y_ℓ^i over all levels is computed; the maximum over all responses for each level is taken.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  allocation_target = mean
  qoi_aggregation = max
```

uses the max rule to aggregate the variance over the qois.

7.2.57.9 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [convergence_tolerance](#)

Stopping criterion based on relative error

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

Multilevel sampling seeks an error balance between the estimator variance and the remaining bias error at the highest level, the two contributors to mean squared error (MSE). Since the remaining bias error is generally unknown, the convergence_tolerance is used to provide a error target relative to the Multifidelity Monte Carlo estimator variance resulting from the pilot sample. If the pilot samples are not shaped for the low-fidelity model, i.e. the number of low-fidelity evaluations is equal to the number of high-fidelity evaluations for each level, the Multifidelity estimator falls back to a Multilevel Monte Carlo estimator which is used to assess the estimator pilot samples variance. The samples allocated at each level are proportional to $\frac{1}{\epsilon^2}$, so each order of magnitude reduction in convergence_tolerance will tend to increase the sample allocation by two orders of magnitude. Therefore, this control should be used with care to avoid allocation of huge sample sets that could overrun available memory.

Default Behavior

The default value for convergence_tolerance is currently .0001, which may be too resolved for expensive simulations or high variance QoI.

7.2.57.10 convergence_tolerance_type

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [convergence_tolerance_type](#)

Sets the type of the convergence tolerance. Can be absolute or relative.

Default Behavior "relative"

Specification

Alias: none

Argument(s): none

Default: relative

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Convergence tolerance type (Group 1)	relative	Use a relative converge criterion.
			absolute	Absolute value for the convergence tolerance.

7.2.57.10.1 [relative](#)

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [convergence_tolerance_type](#)
- [relative](#)

Use a relative converge criterion.

Specification

Alias: none

Argument(s): none

Description

Computes an initial tolerance ε_{init}^2 using the pilot samples and applies the value of keyword `convergence_tolerance` c_t to compute the target convergence_tolerance as $\varepsilon_{target}^2 = \varepsilon_{init}^2 \cdot c_t$. Similarly if `convergence_tolerance_target` is equal to `cost_constraint`. See description in current reference manual at `method.multilevel_sampling.convergence_tolerance` as reference as well.

7.2.57.10.2 [absolute](#)

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [convergence_tolerance_type](#)
- [absolute](#)

Absolute value for the convergence tolerance.

Specification

Alias: none

Argument(s): none

Description

Expects an absolute value for the convergence tolerance which will be used as target. If keyword `convergence_tolerance_target` is equal to `variance_constraint`, this value is a target variance (ϵ^2); if keyword `convergence_tolerance_target` is equal to `cost_constraint`, this value is a target cost.

7.2.57.11 `convergence_tolerance_target`

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [convergence_tolerance_target](#)

Sets the target of the MLMC sample allocation, i.e. the constraint of the MLMC sample allocation problem

Default Behavior "variance_constraint"

Specification

Argument(s): none

7.2.57.12 max_iterations

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [max_iterations](#)

Stopping criterion based on number of refinement iterations within the multilevel sample allocation

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: `fsu_cvt` , `local_reliability`: 25; `global_{reliability , interval_est , evidence}` / `efficient_global`: 25*n)

Description

Multilevel sampling is an iterative procedure that estimates the optimal number of samples for each level based on cost and observed variance. On each iteration, additional samples are performed and more accurate variance estimates are computed, leading to updated sample allocations. The process terminates when either no additional samples are allocated or the `max_iterations` control is enforced.

Default Behavior

The default value for `max_iterations` varies by method. For `multilevel_sampling`, the default value is 25.

7.2.57.13 max_function_evaluations

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [max_function_evaluations](#)

Stopping criterion based on maximum function evaluations

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 1000

Description

For multilevel and multifidelity sampling methods, this specification provides a computational budget, indicating that the mean squared error (MSE) of the estimator is to be minimized within this budget. In these methods, the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error for the highest-fidelity/most-resolved model).

The budget is provided in terms of the equivalent number of high-fidelity/fine-resolution evaluations. Default value is SZ_MAX (the maximum storable size_t), which is a special value indicating that a budget has not been specified.

7.2.57.14 final_statistics

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)

Indicate the type of final statistics to be returned by a UQ method

Specification

Alias: none

Argument(s): none

Default: qoi_statistics

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final statistics type (Group 1)	estimator_performance	Return estimator performance as the final results of a UQ method
			qoi_statistics	Return the quantity of interest (QoI) statistics as the final results of a UQ method

Description

In nested execution contexts, an inner UQ method may return either a final set of QoI statistics (e.g., for optimization of moments or level mappings over design parameters within optimization under uncertainty) or a set of performance metrics (e.g., for maximization of performance over hyper-parameters within model tuning).

Default Behavior Return a final set of QoI statistics.

7.2.57.14.1 estimator_performance

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [estimator_performance](#)

Return estimator performance as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Description

Instead of QoI moments and level mappings, return the performance of the estimator in terms of its variance and aggregate cost. These metrics are targeted in the context of model tuning for multifidelity UQ methods.

Usage Tips Estimator variance can be minimized when total budget is specified. Alternatively, total budget can be minimized when estimator accuracy is specified. This is managed by the nested model response mappings that define the outer loop objective and constraints, sharing conceptual similarity to the RIA and PMA formulations for optimization with local reliability (refer to RBDO methods in the Theory Manual).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
  max_function_evaluations = 1000
```

```

pilot_samples = 25
seed = 8674132
solution_mode pilot_projection
final_statistics estimator_performance

```

7.2.57.14.2 qoi_statistics

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)

Return the quantity of interest (QoI) statistics as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional		distribution	Placeholder for future capabilities

Description

In most nested execution contexts, the outer loop is operating on the set of moments and level mappings returned by an inner loop UQ method. Thus `qoi_statistics` is the default.

Sub-specifications include the type of `final_moments` (none, standard, or central) and the sense of distribution functions (cumulative or complementary).

Examples

```

method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
  max_function_evaluations = 1000
  pilot_samples = 25
  seed = 8674132
  solution_mode online_pilot
  final_statistics qoi_statistics

```

7.2.57.14.2.1 `final_moments`

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Final moment type (Group 1)	Dakota Keyword none	Dakota Keyword Description Omit moments from the set of final statistics.
			standard	Output standardized moments and include them within the set of final statistics.
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to none as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.57.14.2.2 none

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

7.2.57.14.2.3 standard

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [standard](#)

Output standardized moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output standardized moments (mean, standard deviation, skewness, and excess kurtosis) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic UQ). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments standard
```

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)

- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.57.15 rng

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required(<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.57.15.1 mt19937

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.57.15.2 rnum2

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.57.16 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [multilevel_sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6
    sample_type lhs
    distribution cumulative

model
  id_model = 'SURR'
  surrogate global,
  dace_method_pointer = 'DACE'
  polynomial quadratic

method
  id_method = 'DACE'
  model_pointer = 'DACE_M'
  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'

variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses
  response_functions = 3
  no_gradients
  no_hessians
```

7.2.58 multifidelity_sampling

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)

Multifidelity sampling methods for UQ

Specification

Alias: multifidelity_mc mfmc

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets
	Optional		pilot_samples	Initial set of samples for multi-level/multifidelity sampling methods.
	Optional		solution_mode	Solution mode for multi-level/multifidelity methods
	Optional		numerical_solve	Specify the situations where numerical optimization is used for MFMC sample allocation
	Optional		sample_type	Selection of sampling strategy
	Optional		export_sample_sequence	Enable export of multi-level/multifidelity sample sequences to individual files

	Optional	<code>convergence_ - tolerance</code>	Stopping criterion based on relative error reduction
	Optional	<code>max_ iterations</code>	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional	<code>max_ function_ - evaluations</code>	Stopping criterion based on maximum function evaluations
	Optional	<code>final_ statistics</code>	Indicate the type of final statistics to be returned by a UQ method
	Optional	<code>rng</code>	Selection of a random number generator
	Optional	<code>model_ pointer</code>	Identifier for model block to be used by a method

Description

An adaptive sampling method that utilizes multifidelity relationships in order to improve efficiency through variance reduction.

Two variants are currently supported, with the former now deprecated and to be replaced by the latter:

- In the case of a hierarchical surrogate model, the two-model approach of Ng and Willcox (2014) is supported and the two most extreme model fidelities or resolutions are employed as the truth model and approximation model.
- In the case of a non-hierarchical surrogate model, the multi-model approach of Peherstorfer et al. (2016) is supported for which all model instances can be integrated into the scheme. Both methods can be used with either a model form sequence or a resolution level sequence.

Control Variate Monte Carlo

In the case of two model fidelities (low fidelity denoted as LF and high fidelity denoted as HF), we employ a control variate approach as described in Ng and Willcox (2014):

$$\hat{Q}_{HF}^{CV} = \hat{Q}_{HF}^{MC} - \beta(\hat{Q}_{LF}^{MC} - \mathbb{E}[Q_{LF}])$$

As opposed to the traditional control variate approach, we do not know $\mathbb{E}[Q_{LF}]$ precisely, but rather we estimate it more accurately than \hat{Q}_{LF}^{MC} based on a sampling increment applied to the LF model. This sampling increment is based again on a total cost minimization procedure that incorporates the relative LF and HF costs and the observed Pearson correlation coefficient ρ_{LH} between Q_{LF} and Q_{HF} . The coefficient β is then determined from the observed LF-HF covariance and LF variance.

Multifidelity Monte Carlo

This approach can be extended to a sequence of low-fidelity approximations using a recursive sampling approach as in Peherstorfer et al. (2016).

$$\hat{Q}_{HF}^{CV} = \hat{Q}_{HF}^{MC} - \sum_{i=1}^M \beta_i (\hat{Q}_{LF_i}^{MC} - \mathbb{E}[Q_{LF_i}])$$

In this case, the variance in the estimate of the i^{th} control mean is reduced by the $(i+1)^{th}$ control variate, such that the variance reduction is limited by the case of an exact estimate of the first control mean (referred to as OCV-1 in Gorodetsky et al., 2020).

Default Behavior

The `multifidelity_sampling` method employs Monte Carlo sample sets by default, but this default can be overridden to use Latin hypercube sample sets using `sample_type lhs`.

Expected Output

The `multifidelity_sampling` method reports estimates of the first four moments and a summary of the evaluations performed for each model fidelity and discretization level. The method does not support any level mappings (response, probability, reliability, generalized reliability) at this time.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Sampling Moments](#) (moments only, not confidence intervals)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Usage Tips

The `multifidelity_sampling` method can be used in combination with either a hierarchical or non-hierarchical model specification for either a model form sequence or a discretization level sequence. For a model form sequence, each model must provide a scalar `solution_level_cost`. For a discretization level sequence, it is necessary to identify the variable string descriptor that controls the resolution levels using `solution_level_control` as well as the associated array of relative costs using `solution_level_cost`.

The hierarchical two-model approach is a special case of the non-hierarchical multi-model approach. The latter gives identical results to the former when restricted to one approximation model; as such, the hierarchical two-model approach is deprecated.

Examples

We provide an example of a multifidelity Monte Carlo study using a non-hierarchical model specification employing multiple approximations.

The following method block:

```
method,
  model_pointer = 'NONHIER'
  multifidelity_sampling
  pilot_samples = 20 seed = 1237
  max_iterations = 10
  convergence_tolerance = .001
```

specifies MFMC in combination with the model identified by the NONHIER pointer.

This NONHIER model specification provides a one-dimensional sequence, here defined by a single truth model and a set of unordered approximation models, each with a single (or default) discretization level:

```
model,
  id_model = 'NONHIER'
```

```

surrogate non_hierarchical
  truth_model = 'HF'
  unordered_model_fidelities = 'LF1' 'LF2'

model,
  id_model = 'LF1'
  interface_pointer = 'LF1_INT'
  simulation
    solution_level_cost = 0.01

model,
  id_model = 'LF2'
  interface_pointer = 'LF2_INT'
  simulation
    solution_level_cost = 0.1

model,
  id_model = 'HF'
  interface_pointer = 'HF_INT'
  simulation
    solution_level_cost = 1.

```

Refer to `dakota/test/dakota_uq*_cvmc.in` and `dakota/test/dakota_uq*_mfmc.in` in the source distribution for additional examples.

7.2.58.1 seed_sequence

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would

continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For $\$L\$$ levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,  
  model_pointer = 'HIERARCH'  
  multilevel_sampling  
  pilot_samples = 100 50 40 30 20  
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.58.2 `fixed_seed`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.58.3 pilot_samples

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [pilot_samples](#)

Initial set of samples for multilevel/multifidelity sampling methods.

Specification

Alias: `initial_samples`

Argument(s): INTEGERLIST

Description

The pilot sample provides initial estimates of variance and/or correlation within the first iteration of a multi-level/multifidelity sampling approach. These initial estimates then guide the algorithm toward additional sample increments in order to iteratively achieve a prescribed error at minimum total cost, or alternatively, minimum error for a prescribed budget.

Default Behavior

100 samples per model fidelity and/or discretization level.

Usage Tips

The number of specified values can be none (default values used for all fidelities and levels), one (all fidelities and levels use the same specified value), the number of discretization levels for every model (each model uses the same discretization level profile), or the aggregate number of discretization levels for all models (samples for each discretization level are distinct for each model).

7.2.58.4 solution_mode

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [solution_mode](#)

Solution mode for multilevel/multifidelity methods

Specification

Alias: none

Argument(s): none

Default: online pilot

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Ensemble Sampling Solution Mode (Group 1)	Dakota Keyword online_pilot	Dakota Keyword Description Specify a solution mode that includes the pilot cost within the sample allocation logic
			offline_pilot	Specify a solution mode that excludes the pilot cost from sample allocation logic
			pilot_projection	Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. The pilot sample can be integrated according to one of three solution modes:

- `online_pilot`: include pilot sample cost within sample allocation (default)
- `offline_pilot`: treat pilot cost as offline and exclude from sample allocation
- `pilot_projection`: only perform the pilot sample and only estimate the expected performance based on a projection of the pilot statistics (useful for method selection)

Default Behavior Online pilot

7.2.58.4.1 online_pilot

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [solution_mode](#)
- [online_pilot](#)

Specify a solution mode that includes the pilot cost within the sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as online cost and is included within the optimal sample allocation logic. This mode is the default.

Additional Discussion It is typically advantageous to start from a smaller pilot sample and then rely on the adaptive logic to increase the sample levels to the optimal level required to achieve the desired accuracy or enforce the prescribed budget. Over-estimation of the pilot, while supporting more robust estimation of correlations and variances, can hide the optimal profile and result in a non-optimal allocation of resources.

7.2.58.4.2 offline_pilot

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [solution_mode](#)
- [offline_pilot](#)

Specify a solution mode that excludes the pilot cost from sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as offline cost and is excluded from the optimal sample allocation logic. This mode is typically used for generating reference performance using an "oracle" approach, i.e., specifying a large pilot sample in order to obtain best-case correlation or variance estimates prior to generating a sample profile.

7.2.58.4.3 pilot_projection

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [solution_mode](#)
- [pilot_projection](#)

Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, evaluations are limited to the pilot sample and these initial estimates are used to project the potential performance under the assumption that these estimates are accurate.

This mode is useful for comparing the projected performance of different estimators, which can inform method selection.

7.2.58.5 numerical_solve

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [numerical_solve](#)

Specify the situations where numerical optimization is used for MFMC sample allocation

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Employ numerical solve (Group 1)	fallback	Fall back to a numerical solve when needed for mitigation in MFMC
			override	Replace MFMC analytic allocation with a numerical solution
	Optional (<i>Choose One</i>)	Optimization Solver (Group 2)	sqp	Uses a sequential quadratic programming method for underlying optimization
			nip	Uses a nonlinear interior point method for underlying optimization

Description

Multifidelity Monte Carlo (MFMC) supports an analytic solution for the allocation of samples per model instance based on response correlations and relative simulation cost. In some situations (over-estimated pilot sample, mis-ordered model correlations), this analytic solution may be either sub-optimal or undefined, requiring mitigation.

This specification allows for control of this mitigation; in particular, whether recourse to a numerical solution is strictly a fallback (default) or is desired as an unconditional override (regardless of the need for specific mitigations).

Further, when a numerical solve is employed, it can utilize either the `sqp` or `nip` solver options.

Default Behavior Analytic is preferred, with `fallback` to numerical only when mitigation is required.

7.2.58.5.1 fallback

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [numerical_solve](#)
- [fallback](#)

Fall back to a numerical solve when needed for mitigation in MFMC

Specification

Alias: none

Argument(s): none

Description

Conditionally employ a numerical solve for allocation of samples per model instance within multifidelity Monte Carlo (MFMC). The analytic allocation is employed unless a problem is encountered (mis-ordered model correlations) that requires mitigation.

Examples

```
method,  
  model_pointer = 'ENSEMBLE'  
  multifidelity_sampling  
    numerical_solve nip fallback  
    max_function_evaluations = 1000  
    pilot_samples = 100  
    seed = 8674132
```

7.2.58.5.2 override

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [numerical_solve](#)
- [override](#)

Replace MFMC analytic allocation with a numerical solution

Specification

Alias: none

Argument(s): none

Description

Unconditionally employ a numerical solve for allocation of samples per model instance within multifidelity Monte Carlo (MFMC). The analytic allocation is replaced with numerical solution using either `sqp` or `nip` solvers.

Usage Tips An unconditional override can be appropriate in the case where you select a pilot sample that may be larger than the anticipated optimal sample profile results (pilot over-estimation). In this context, the numerical optimization has greater freedom to work around the incurred pilot cost and find a solution that optimally incorporates the pilot.

Additional Discussion

Examples

```
method,  
  model_pointer = 'ENSEMBLE'  
  multifidelity_sampling  
    numerical_solve nip override  
    max_function_evaluations = 1000  
    pilot_samples = 100  
    seed = 8674132
```

7.2.58.5.3 `sqp`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [numerical_solve](#)
- [sqp](#)

Uses a sequential quadratic programming method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `sqp` keyword directs Dakota to use a sequential quadratic programming method to solve that problem. A sequential quadratic programming solves a sequence of linearly constrained quadratic optimization problems to arrive at the solution to the optimization problem.

7.2.58.5.4 `nip`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [numerical_solve](#)
- [nip](#)

Uses a nonlinear interior point method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `nip` keyword directs Dakota to use a nonlinear interior point to solve that problem. A nonlinear interior point method traverses the interior of the feasible region to arrive at the solution to the optimization problem.

7.2.58.6 `sample_type`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional <i>Required (Choose One)</i>	Description of Group Sample Type (Group 1)	Dakota Keyword lhs	Dakota Keyword Description Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.58.6.1 `lhs`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)

- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.58.6.2 random

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.58.7 export_sample_sequence

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [export_sample_sequence](#)

Enable export of multilevel/multifidelity sample sequences to individual files

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

When this option is active, separate output files are written for each unique sample increment and are tagged by algorithm type, simulation interface, iteration count, level count, and the number of samples as described below.

The data content is comprised of the input variables only, without corresponding responses, as an intended use case is to support evaluation of these sample sets offline.

Default Behavior

If not specified, the `annotated` format is assumed.

Expected Output

Separate output files are generated according to the following format: `{ml/cv}_{interface_id}_{iteration_number}_{level_number}_{number_of_samples}.dat`.

With respect to the algorithm type, interface id, and level counter, the following definitions are employed:

- Multilevel MC with hierarchical model: `ml_` is pre-pended for all sample increments and sample sets are tagged with the interface id from the HF model.
- Control Variate MC with hierarchical model (deprecated): `cv_` is prepended for all sample increments, shared sample sets are tagged with the HF interface id, and LF-only refinements are tagged by the LF interface id.
- Multilevel-Control Variate MC with hierarchical model: employs a combination of exports from the two cases above. `ml_` is pre-pended for all HF sample increments and sample sets are tagged with the interface id from the HF model; `cv_` is prepended for all LF increments and sample sets are tagged with the LF interface id. Note that the LF model shares the same `ml_` sample sets, but a redundant file is not created for this data.
- Non-hierarchical approaches (Multifidelity MC, Approximate Control Variate): `cv_` is prepended for all sample increments and sample sets are tagged with the corresponding model interface id. The level number corresponds to the index of the approximation model for LF increments and to the id of the truth model (number of LF approximations + 1) for shared increments.

With respect to iteration count, pilot samples are tagged with iteration 0.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  output silent
  export_sample_sequence
```

results in enabling the sample output of sample increments for each level to individual files using the default `annotated` format.

The following variables block

```
variables,
  id_variables = 'LF_VARS'
  uniform_uncertain = 7
  lower_bounds = 7*-1.
  upper_bounds = 7* 1.
  descriptors 'u1' 'u2' 'u3' 'u4' 'u5' 'u6' 'u7'
  discrete_state_set
  integer = 2
  num_set_values = 4 1
  set_values = 5 15 30 60 # number of spatial coords
               3         # number of Fourier solution modes
  initial_state = 5 3
  descriptors 'N_x' 'N_mod'
```

illustrates how to define descriptors for the variables. For this case, the descriptors `u1` through `u7`, `N_x`, and `N_mod` are reported in the sample files to help annotate the data.

7.2.58.7.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [export_sample_sequence](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.58.7.2 annotated

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [export_sample_sequence](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.58.7.3 freeform

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [export_sample_sequence](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.58.8 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [convergence_tolerance](#)

Stopping criterion based on relative error reduction

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration through satisfaction of a specified accuracy at minimum total cost.

For multilevel and multifidelity sampling methods, it is a **relative convergence tolerance** on the mean squared error (MSE), where the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error).

The reference estimator variance is then defined as follows:

- **Multilevel approaches** (`multilevel_sampling` and `multilevel_multifidelity_sampling`): tolerance relative to initial multilevel Monte Carlo (MLMC) error after pilot sample
- **Control variate approaches** (`multifidelity_sampling` and `approximate_control_variate`): relative to Monte Carlo (MC) error from pilot sample where these are all initial estimator variances for the algorithm, recognizing that control variate approaches can extract no benefit from low-fidelity pilot samples prior to the definition of corresponding sample increments.

Permissible values are between 0 and 1, non-inclusive. Default value is 1.e-4.

7.2.58.9 max_iterations

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: fsu_cvt , local_reliability: 25; global_{reliability , interval_est , evidence} / efficient_global: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

See Also

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.58.10 max_function_evaluations

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [max_function_evaluations](#)

Stopping criterion based on maximum function evaluations

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 1000

Description

For multilevel and multifidelity sampling methods, this specification provides a computational budget, indicating that the mean squared error (MSE) of the estimator is to be minimized within this budget. In these methods, the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error for the highest-fidelity/most-resolved model).

The budget is provided in terms of the equivalent number of high-fidelity/fine-resolution evaluations. Default value is SZ_MAX (the maximum storable size_t), which is a special value indicating that a budget has not been specified.

7.2.58.11 final_statistics

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)

Indicate the type of final statistics to be returned by a UQ method

Specification

Alias: none

Argument(s): none

Default: qoi_statistics

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final statistics type (Group 1)	estimator_-performance	Return estimator performance as the final results of a UQ method

			qoi_statistics	Return the quantity of interest (QoI) statistics as the final results of a UQ method
--	--	--	--------------------------------	--

Description

In nested execution contexts, an inner UQ method may return either a final set of QoI statistics (e.g., for optimization of moments or level mappings over design parameters within optimization under uncertainty) or a set of performance metrics (e.g., for maximization of performance over hyper-parameters within model tuning).

Default Behavior Return a final set of QoI statistics.

7.2.58.11.1 estimator_performance

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [estimator_performance](#)

Return estimator performance as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Description

Instead of QoI moments and level mappings, return the performance of the estimator in terms of its variance and aggregate cost. These metrics are targeted in the context of model tuning for multifidelity UQ methods.

Usage Tips Estimator variance can be minimized when total budget is specified. Alternatively, total budget can be minimized when estimator accuracy is specified. This is managed by the nested model response mappings that define the outer loop objective and constraints, sharing conceptual similarity to the RIA and PMA formulations for optimization with local reliability (refer to RBDO methods in the Theory Manual).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
    max_function_evaluations = 1000
    pilot_samples = 25
    seed = 8674132
  solution_mode pilot_projection
  final_statistics estimator_performance
```

7.2.58.11.2 qoi_statistics

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)

Return the quantity of interest (QoI) statistics as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional		distribution	Selection of cumulative or complementary cumulative functions

Description

In most nested execution contexts, the outer loop is operating on the set of moments and level mappings returned by an inner loop UQ method. Thus `qoi_statistics` is the default.

Sub-specifications include the type of `final_moments` (none, standard, or central) and the sense of distribution functions (cumulative or complementary).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
    max_function_evaluations = 1000
    pilot_samples = 25
    seed = 8674132
    solution_mode online_pilot
    final_statistics qoi_statistics
```

7.2.58.11.2.1 final_moments

- [Keywords Area](#)

- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Select standard rejection
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to `none` as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.58.11.2.2 none

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

7.2.58.11.2.3 standard

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [standard](#)

Select standard rejection

Specification

Alias: none

Argument(s): none

Description

The use of a standard rejection approach in the Monte Carlo Markov Chain algorithm.

7.2.58.11.2.4 central

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.58.11.2.5 distribution

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.58.11.2.6 cumulative

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.58.11.2.7 complementary

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.58.12 rng

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required(<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.58.12.1 mt19937

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.58.12.2 rnum2

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.58.13 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [multifidelity_sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
  samples = 10
  seed = 98765 rng rnum2
  response_levels = 0.1 0.2 0.6
                   0.1 0.2 0.6
                   0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'
```

```

    surrogate global,
    dace_method_pointer = 'DACE'
    polynomial quadratic

method
  id_method = 'DACE'
  model_pointer = 'DACE_M'
  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single

  response_functions = 3
  no_gradients
  no_hessians

```

7.2.59 multilevel_multifidelity_sampling

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)

Multilevel-Multifidelity sampling methods for UQ

Specification

Alias: multilevel_multifidelity_mc mlmfmc

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		seed_sequence	Sequence of seed values for multi-stage random sampling
	Optional		fixed_seed	Reuses the same seed value for multiple random sampling sets

	Optional	pilot_samples	Initial set of samples for multi-level/multifidelity sampling methods.
	Optional	solution_mode	Solution mode for multi-level/multifidelity methods
	Optional	sample_type	Selection of sampling strategy
	Optional	export_sample_sequence	Enable export of multi-level/multifidelity sample sequences to individual files
	Optional	convergence_tolerance	Stopping criterion based on relative error reduction
	Optional	max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional	max_function_evaluations	Stopping criterion based on maximum function evaluations
	Optional	final_statistics	Indicate the type of final statistics to be returned by a UQ method
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

An adaptive sampling method that utilizes both multilevel and multifidelity relationships within a hierarchical surrogate model in order to improve efficiency through variance reduction.

In the case of a multilevel relationship, multilevel Monte Carlo methods are used to compute an optimal sample allocation per level, and in the case of a multifidelity relationship, control variate Monte Carlo methods are used to compute an optimal sample allocation per fidelity. These two approaches can also be combined, resulting in the multilevel-multifidelity sampling approach below.

Multilevel Control Variate Monte Carlo

If both multilevel and multifidelity structure are included within a hierarchical model specification, then an inner control variate can be applied across two model fidelities for each level within an outer multilevel approach.

On each level, a control variate is active for the discrepancy Y_ℓ based on

$$Y_\ell^* = Y_\ell + \alpha_\ell (\hat{Y}_\ell^{\text{LF}} - \mathbb{E}[Y_\ell^{\text{LF}}]),$$

where $Y_\ell^{\text{LF}} = \gamma_\ell Q_\ell^{\text{LF}} - Q_\ell^{\text{HF}}$.

The optimal parameter γ_ℓ is computed from the correlation properties between model forms and discretization levels (see the theory manual for further details) and the optimal allocation N_ℓ (per level) is finally obtained from it.

Default Behavior

The `multilevel_multifidelity_sampling` method employs Monte Carlo sample sets by default, but this default can be overridden to use Latin hypercube sample sets using `sample_type lhs`.

Expected Output

The `multilevel_multifidelity_sampling` method reports estimates of the first four moments and a summary of the evaluations performed for each model fidelity and discretization level. The method does not support any level mappings (response, probability, reliability, generalized reliability) at this time.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Sampling Moments](#) (moments only, not confidence intervals)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Usage Tips

The `multilevel_multifidelity_sampling` method must be used in combination with a hierarchical model specification. The highest and lowest fidelity model must provide multiple discretization levels, for which it is necessary to identify the variable string descriptor that controls the resolution levels using `solution_level_control` as well as the associated array of relative costs using `solution_level_cost`.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_multifidelity_sampling
  pilot_samples = 20 seed = 1237           #s0, #s1, #s2, #s3, #p0, #p1
  convergence_tolerance = .01             #s0, #s2, #s3, #p0, #p1
```

specifies a multilevel-multifidelity Monte Carlo study in combination with the model identified by the HIERARCH pointer. This model specification provides a two-dimensional hierarchy, comprised of two model forms each with four discretization levels:

```
model,
  id_model = 'HIERARCH'
  surrogate hierarchical
  ordered_model_fidelities = 'LF' 'HF'

model,
  id_model = 'LF'
  simulation
  solution_level_control = 'N_x'
  solution_level_cost = 375. 10125. 81000. 648000.

model,
```

```
id_model = 'HF'  
simulation  
  solution_level_control = 'N_x'  
  solution_level_cost = 5.67e+5 4.536e+6 2.1e+7 1.68e+8
```

Refer to `dakota/test/dakota_uq_heat_eq_mlcvmc.in` in the source distribution for this case as well as additional examples.

7.2.59.1 seed_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For $\$L\$$ levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then

subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,  
  model_pointer = 'HIERARCH'  
  multilevel_sampling  
  pilot_samples = 100 50 40 30 20  
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

See Also

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.59.2 fixed_seed

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.59.3 pilot_samples

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [pilot_samples](#)

Initial set of samples for multilevel/multifidelity sampling methods.

Specification

Alias: initial_samples

Argument(s): INTEGERLIST

Description

The pilot sample provides initial estimates of variance and/or correlation within the first iteration of a multi-level/multifidelity sampling approach. These initial estimates then guide the algorithm toward additional sample increments in order to iteratively achieve a prescribed error at minimum total cost, or alternatively, minimum error for a prescribed budget.

Default Behavior

100 samples per model fidelity and/or discretization level.

Usage Tips

The number of specified values can be none (default values used for all fidelities and levels), one (all fidelities and levels use the same specified value), the number of discretization levels for every model (each model uses the same discretization level profile), or the aggregate number of discretization levels for all models (samples for each discretization level are distinct for each model).

7.2.59.4 solution_mode

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [solution_mode](#)

Solution mode for multilevel/multifidelity methods

Specification

Alias: none

Argument(s): none

Default: online pilot

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Ensemble Sampling Solution Mode (Group 1)	Dakota Keyword online_pilot	Dakota Keyword Description Specify a solution mode that includes the pilot cost within the sample allocation logic
			offline_pilot	Specify a solution mode that excludes the pilot cost from sample allocation logic
			pilot_projection	Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. The pilot sample can be integrated according to one of three solution modes:

- `online_pilot`: include pilot sample cost within sample allocation (default)
- `offline_pilot`: treat pilot cost as offline and exclude from sample allocation
- `pilot_projection`: only perform the pilot sample and only estimate the expected performance based on a projection of the pilot statistics (useful for method selection)

Default Behavior Online pilot

7.2.59.4.1 `online_pilot`

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [solution_mode](#)
- [online_pilot](#)

Specify a solution mode that includes the pilot cost within the sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as online cost and is included within the optimal sample allocation logic. This mode is the default.

Additional Discussion It is typically advantageous to start from a smaller pilot sample and then rely on the adaptive logic to increase the sample levels to the optimal level required to achieve the desired accuracy or enforce the prescribed budget. Over-estimation of the pilot, while supporting more robust estimation of correlations and variances, can hide the optimal profile and result in a non-optimal allocation of resources.

7.2.59.4.2 offline_pilot

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [solution_mode](#)
- [offline_pilot](#)

Specify a solution mode that excludes the pilot cost from sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as offline cost and is excluded from the optimal sample allocation logic. This mode is typically used for generating reference performance using an "oracle" approach, i.e., specifying a large pilot sample in order to obtain best-case correlation or variance estimates prior to generating a sample profile.

7.2.59.4.3 pilot_projection

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [solution_mode](#)
- [pilot_projection](#)

Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, evaluations are limited to the pilot sample and these initial estimates are used to project the potential performance under the assumption that these estimates are accurate.

This mode is useful for comparing the projected performance of different estimators, which can inform method selection.

7.2.59.5 sample_type

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Sample Type (Group 1)	lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.59.5.1 lhs

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.59.5.2 random

- [Keywords Area](#)
- [method](#)

- [multilevel_multifidelity_sampling](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.59.6 export_sample_sequence

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [export_sample_sequence](#)

Enable export of multilevel/multifidelity sample sequences to individual files

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional (Choose One)	Tabular Format (Group 1)	<code>custom_annotated</code>	Selects custom-annotated tabular file format
			<code>annotated</code>	Selects annotated tabular file format
			<code>freeform</code>	Selects freeform file format

Description

When this option is active, separate output files are written for each unique sample increment and are tagged by algorithm type, simulation interface, iteration count, level count, and the number of samples as described below. The data content is comprised of the input variables only, without corresponding responses, as an intended use case is to support evaluation of these sample sets offline.

Default Behavior

If not specified, the `annotated` format is assumed.

Expected Output

Separate output files are generated according to the following format: `{ml/cv}_{interface_id}_{iteration_number}_{level_number}_{number_of_samples}.dat`.

With respect to the algorithm type, interface id, and level counter, the following definitions are employed:

- Multilevel MC with hierarchical model: `m1_` is pre-pended for all sample increments and sample sets are tagged with the interface id from the HF model.
- Control Variate MC with hierarchical model (deprecated): `cv_` is prepended for all sample increments, shared sample sets are tagged with the HF interface id, and LF-only refinements are tagged by the LF interface id.
- Multilevel-Control Variate MC with hierarchical model: employs a combination of exports from the two cases above. `m1_` is pre-pended for all HF sample increments and sample sets are tagged with the interface id from the HF model; `cv_` is prepended for all LF increments and sample sets are tagged with the LF interface id. Note that the LF model shares the same `m1_` sample sets, but a redundant file is not created for this data.
- Non-hierarchical approaches (Multifidelity MC, Approximate Control Variate): `cv_` is prepended for all sample increments and sample sets are tagged with the corresponding model interface id. The level number corresponds to the index of the approximation model for LF increments and to the id of the truth model (number of LF approximations + 1) for shared increments.

With respect to iteration count, pilot samples are tagged with iteration 0.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  output silent
  export_sample_sequence
```

results in enabling the sample output of sample increments for each level to individual files using the default `annotated` format.

The following variables block

```

variables,
  id_variables = 'LF_VARS'
  uniform_uncertain = 7
  lower_bounds = 7*-1.
  upper_bounds = 7* 1.
  descriptors 'u1' 'u2' 'u3' 'u4' 'u5' 'u6' 'u7'
  discrete_state_set
    integer = 2
    num_set_values = 4 1
    set_values = 5 15 30 60 # number of spatial coords
                  3      # number of Fourier solution modes
    initial_state = 5 3
    descriptors 'N_x' 'N_mod'

```

illustrates how to define descriptors for the variables. For this case, the descriptors `u1` through `u7`, `N_x`, and `N_mod` are reported in the sample files to help annotate the data.

7.2.59.6.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [export_sample_sequence](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file

	Optional	interface_id	Enable interface ID column in custom-annotated tabular file
--	-----------------	------------------------------	---

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether header row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9          1.1          0.0002          0.26           0.76
2             0.90009    1.1 0.0001996404857  0.2601620081    0.759955

7.2.59.6.2 annotated

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [export_sample_sequence](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009       1.1 0.0001996404857 0.2601620081 0.759955

```

7.2.59.6.3 freeform

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [export_sample_sequence](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.

- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.59.7 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [convergence_tolerance](#)

Stopping criterion based on relative error reduction

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration through satisfaction of a specified accuracy at minimum total cost.

For multilevel and multifidelity sampling methods, it is a **relative convergence tolerance** on the mean squared error (MSE), where the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error).

The reference estimator variance is then defined as follows:

- Multilevel approaches (`multilevel_sampling` and `multilevel_multifidelity_sampling`): tolerance relative to initial multilevel Monte Carlo (MLMC) error after pilot sample
- Control variate approaches (`multifidelity_sampling` and `approximate_control_variate`): relative to Monte Carlo (MC) error from pilot sample where these are all initial estimator variances for the algorithm, recognizing that control variate approaches can extract no benefit from low-fidelity pilot samples prior to the definition of corresponding sample increments.

Permissible values are between 0 and 1, non-inclusive. Default value is 1.e-4.

7.2.59.8 `max_iterations`

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: `fsu_cvt` , `local_reliability`: 25; `global_{reliability , interval_est , evidence}` / `efficient_global`: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

See Also

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.59.9 max_function_evaluations

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [max_function_evaluations](#)

Stopping criterion based on maximum function evaluations

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 1000

Description

For multilevel and multifidelity sampling methods, this specification provides a computational budget, indicating that the mean squared error (MSE) of the estimator is to be minimized within this budget. In these methods, the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error for the highest-fidelity/most-resolved model).

The budget is provided in terms of the equivalent number of high-fidelity/fine-resolution evaluations. Default value is SZ_MAX (the maximum storable size_t), which is a special value indicating that a budget has not been specified.

7.2.59.10 final_statistics

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)

Indicate the type of final statistics to be returned by a UQ method

Specification

Alias: none

Argument(s): none

Default: qoi_statistics

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final statistics type (Group 1)	estimator_performance	Return estimator performance as the final results of a UQ method
			qoi_statistics	Return the quantity of interest (QoI) statistics as the final results of a UQ method

Description

In nested execution contexts, an inner UQ method may return either a final set of QoI statistics (e.g., for optimization of moments or level mappings over design parameters within optimization under uncertainty) or a set of performance metrics (e.g., for maximization of performance over hyper-parameters within model tuning).

Default Behavior Return a final set of QoI statistics.

7.2.59.10.1 estimator_performance

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [estimator_performance](#)

Return estimator performance as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Description

Instead of QoI moments and level mappings, return the performance of the estimator in terms of its variance and aggregate cost. These metrics are targeted in the context of model tuning for multifidelity UQ methods.

Usage Tips Estimator variance can be minimized when total budget is specified. Alternatively, total budget can be minimized when estimator accuracy is specified. This is managed by the nested model response mappings that define the outer loop objective and constraints, sharing conceptual similarity to the RIA and PMA formulations for optimization with local reliability (refer to RBDO methods in the Theory Manual).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
  max_function_evaluations = 1000
```

```

pilot_samples = 25
seed = 8674132
solution_mode pilot_projection
final_statistics estimator_performance

```

7.2.59.10.2 qoi_statistics

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)

Return the quantity of interest (QoI) statistics as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.
	Optional		distribution	Selection of cumulative or complementary cumulative functions

Description

In most nested execution contexts, the outer loop is operating on the set of moments and level mappings returned by an inner loop UQ method. Thus `qoi_statistics` is the default.

Sub-specifications include the type of `final_moments` (none, standard, or central) and the sense of distribution functions (cumulative or complementary).

Examples

```

method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
  max_function_evaluations = 1000
  pilot_samples = 25
  seed = 8674132
  solution_mode online_pilot
  final_statistics qoi_statistics

```

7.2.59.10.2.1 final_moments

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.
			standard	Select standard rejection
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to `none` as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.59.10.2.2 none

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

7.2.59.10.2.3 standard

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [standard](#)

Select standard rejection

Specification

Alias: none

Argument(s): none

Description

The use of a standard rejection approach in the Monte Carlo Markov Chain algorithm.

7.2.59.10.2.4 central

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

7.2.59.10.2.5 distribution

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.59.10.2.6 cumulative

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.59.10.2.7 complementary

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.59.11 rng

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.59.11.1 mt19937

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.59.11.2 rnum2

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.59.12 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [multilevel_multifidelity_sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'

	Optional	max_function_evaluations	Stopping criterion based on maximum function evaluations
	Optional	final_statistics	Indicate the type of final statistics to be returned by a UQ method
	Optional	rng	Selection of a random number generator

	Optional	<code>model_pointer</code>	Identifier for model block to be used by a method
--	-----------------	----------------------------	---

Description

An adaptive sampling method that utilizes multifidelity relationships in order to improve efficiency through variance reduction. It employs a non-hierarchical model to manage an unordered set of lower-fidelity approximations to a single truth model.

Compared to multifidelity Monte Carlo (MFMC), ACV relaxes the nested sampling of a recursive emulator, instead targeting the truth model's variance with each control variate pair. While the ensemble of control variates appears identical to MFMC:

$$\hat{Q}_{HF}^{CV} = \hat{Q}_{HF}^{MC} - \sum_{i=1}^M \beta_i (\hat{Q}_{LF_i}^{MC} - \mathbb{E}[Q_{LF_i}])$$

the sample patterns used for the constituent estimators differ as depicted in Gorodetsky et al. (2020), Figure 2. Two ACV variants are currently implemented, ACV-MF and ACV-IS, with ACV-KL to follow.

Default Behavior

The `approximate_control_variate` method employs Monte Carlo sample sets by default, but this default can be overridden to use Latin hypercube sample sets using `sample_type lhs`.

Expected Output

The `approximate_control_variate` method reports estimates of the first four moments and a summary of the evaluations performed for each model fidelity and discretization level. The method does not support any level mappings (response, probability, reliability, generalized reliability) at this time.

Expected HDF5 Output

If Dakota was built with HDF5 support and run with the `hdf5` keyword, this method writes the following results to HDF5:

- [Sampling Moments](#) (moments only, not confidence intervals)

In addition, the execution group has the attribute `equiv_hf_evals`, which records the equivalent number of high-fidelity evaluations.

Usage Tips

The `approximate_control_variate` method must be used in combination with a non-hierarchical model specification that defines either a model form sequence or a discretization level sequence. For a model form sequence, each model must provide a scalar `solution_level_cost`. For a discretization level sequence, `solution_level_control` must identify the variable string descriptor that controls the resolution levels and the associated array of relative costs must be provided using `solution_level_cost`.

Examples

The following method block:

```
method,
  model_pointer = 'NONHIER'
  approximate_control_variate
    acv_mf nip
    pilot_samples = 20 seed = 1237
    max_iterations = 10
    convergence_tolerance = .001
```

specifies ACV-MF using the nonlinear interior point (NIP) solver in combination with the model identified by the NONHIER pointer.

This NONHIER model specification provides a one-dimensional sequence, here defined by a single truth model and a set of unordered approximation models, each with a single (or default) discretization level:

```

model,
  id_model = 'NONHIER'
  surrogate non_hierarchical
  truth_model = 'HF'
  unordered_model_fidelities = 'LF1' 'LF2'

model,
  id_model = 'LF1'
  interface_pointer = 'LF1_INT'
  simulation
  solution_level_cost = 1

model,
  id_model = 'LF2'
  interface_pointer = 'LF2_INT'
  simulation
  solution_level_cost = 16

model,
  id_model = 'HF'
  interface_pointer = 'HF_INT'
  simulation
  solution_level_cost = 256.

```

Refer to `dakota/test/dakota_uq_diffusion_acv3_cost4.in` and `dakota/test/dakota_uq-_tunable_acv.in` in the source distribution for this case as well as additional examples.

Refer to [Gorodetsky et al., JCP (408), 2020] for more detailed algorithm descriptions, theoretical considerations, and a helpful sample set diagram.

Approximate control variate (ACV) algorithm that mimics MFMC by employing a nested pyramid sample pattern

This ACV variant uses sample set definitions that are similar to multifidelity Monte Carlo (MFMC), in that sample sets are nested with each new level adding an increment on top of the previous.

Specification

Alias: acv_mf

Argument(s): none

Theory

Refer to [37] for a helpful sample set diagram.

7.2.60.3 acv_kl

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [acv_kl](#)

Approximate control variate (ACV) algorithm that optimizes a mix of hierarchial and non-hierarchial schemes

Specification

Alias: acv_adaptive

Argument(s): none

Description

This ACV variant is not yet implemented. ACV-KL enumerates a set of free parameters, K and L, that mix hierarchial and non-hierarchial sampling schemes in order to obtain the best estimator for a particular budget or accuracy target.

Theory

Refer to [37] for additional details.

7.2.60.4 pilot_samples

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [pilot_samples](#)

Initial set of samples for multilevel/multifidelity sampling methods.

Specification

Alias: initial_samples

Argument(s): INTEGERLIST

Description

The pilot sample provides initial estimates of variance and/or correlation within the first iteration of a multi-level/multifidelity sampling approach. These initial estimates then guide the algorithm toward additional sample increments in order to iteratively achieve a prescribed error at minimum total cost, or alternatively, minimum error for a prescribed budget.

Default Behavior

100 samples per model fidelity and/or discretization level.

Usage Tips

The number of specified values can be none (default values used for all fidelities and levels), one (all fidelities and levels use the same specified value), the number of discretization levels for every model (each model uses the same discretization level profile), or the aggregate number of discretization levels for all models (samples for each discretization level are distinct for each model).

7.2.60.5 solution_mode

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [solution_mode](#)

Solution mode for multilevel/multifidelity methods

Specification

Alias: none

Argument(s): none

Default: online pilot

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Ensemble Sampling Solution Mode (Group 1)	online_pilot	Specify a solution mode that includes the pilot cost within the sample allocation logic
			offline_pilot	Specify a solution mode that excludes the pilot cost from sample allocation logic
			pilot_projection	Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. The pilot sample can be integrated according to one of three solution modes:

- `online_pilot`: include pilot sample cost within sample allocation (default)
- `offline_pilot`: treat pilot cost as offline and exclude from sample allocation
- `pilot_projection`: only perform the pilot sample and only estimate the expected performance based on a projection of the pilot statistics (useful for method selection)

Default Behavior Online pilot

7.2.60.5.1 `online_pilot`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [solution_mode](#)
- [online_pilot](#)

Specify a solution mode that includes the pilot cost within the sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as online cost and is included within the optimal sample allocation logic. This mode is the default.

Additional Discussion It is typically advantageous to start from a smaller pilot sample and then rely on the adaptive logic to increase the sample levels to the optimal level required to achieve the desired accuracy or enforce the prescribed budget. Over-estimation of the pilot, while supporting more robust estimation of correlations and variances, can hide the optimal profile and result in a non-optimal allocation of resources.

7.2.60.5.2 `offline_pilot`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [solution_mode](#)
- [offline_pilot](#)

Specify a solution mode that excludes the pilot cost from sample allocation logic

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, the cost of pilot sampling is treated as offline cost and is excluded from the optimal sample allocation logic. This mode is typically used for generating reference performance using an "oracle" approach, i.e., specifying a large pilot sample in order to obtain best-case correlation or variance estimates prior to generating a sample profile.

7.2.60.5.3 `pilot_projection`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [solution_mode](#)
- [pilot_projection](#)

Specify a solution mode that estimates performance based on projecting initial correlation/variance estimates from a pilot sample

Specification

Alias: none

Argument(s): none

Description

Multilevel / multifidelity sampling methods are adaptive UQ methods that utilize a pilot sample to estimate an initial set of correlations or variances, and then augment the pilot with additional sample increments to optimally allocate resources. In this mode, evaluations are limited to the pilot sample and these initial estimates are used to project the potential performance under the assumption that these estimates are accurate.

This mode is useful for comparing the projected performance of different estimators, which can inform method selection.

7.2.60.6 `truth_fixed_by_pilot`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [truth_fixed_by_pilot](#)

Option to suppress any increment to the number of truth samples

Specification

Alias: none

Argument(s): none

Description

In some cases, it may be impractical to increment an initial set of truth model samples, for example due to their extreme computational cost or due to the use of legacy data sets that can no longer be augmented. To fix the number of truth model evaluations to only those prescribed in the pilot sample, the `truth_fixed_by_pilot` keyword can be used.

Default Behavior

The default is to allow the number of truth samples to advance beyond those specified in the pilot, while seeking an optimal sample profile.

Additional Discussion

The optimization problem is formulated using linear constraints and a reduced set of design variables, one per approximation model.

This option is most relevant in the default `online_pilot` solution mode, which would normally iterate to determine the optimal number of truth samples. With `truth_fixed_by_pilot`, the number of truth samples is fixed within the optimization and no iteration occurs.

For the `pilot_projection` solution mode, the optimization formulation searches only over the approximation samples, providing an optimal projection subject to the fixed truth constraint.

The `offline_pilot` solution mode is not iterative and assumes that the offline pilot has accurately estimated the correlations and variances. In this case, the online profile is independent and it is not necessary to refine the truth model samples beyond the initial estimate of the optimal allocation. The `truth_fixed_by_pilot` specification has no additional effect beyond these existing constraints.

7.2.60.7 `sqp`

- [Keywords Area](#)

- [method](#)
- [approximate_control_variate](#)
- [sqp](#)

Uses a sequential quadratic programming method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `sqp` keyword directs Dakota to use a sequential quadratic programming method to solve that problem. A sequential quadratic programming solves a sequence of linearly constrained quadratic optimization problems to arrive at the solution to the optimization problem.

7.2.60.8 nip

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [nip](#)

Uses a nonlinear interior point method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `nip` keyword directs Dakota to use a nonlinear interior point to solve that problem. A nonlinear interior point method traverses the interior of the feasible region to arrive at the solution to the optimization problem.

7.2.60.9 seed_sequence

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [seed_sequence](#)

Sequence of seed values for multi-stage random sampling

Specification

Alias: none

Argument(s): INTEGERLIST

Default: system-generated (non-repeatable)

Description

This specification allows the stipulation of seed values (passed to a random number generator) for each of a set of stages within a multi-stage random sampling algorithm.

This is particularly useful for reusing sample sets (via restart) that were generated in some other context (e.g., from a single-stage study) within a multi-stage algorithm execution. Normally the random number sequence would continue from a seed specified for the initial sample set, making subsequent sample sets more difficult to recreate outside of their original context. With finer granularity in the seed specification for multi-stage samplers, intermediate portions of a sampling sequence can now be more readily recreated and reused.

Default Behavior

As for the scalar case, the default is no seed control, such that a query to a system clock will be used to randomize results.

Usage Tips

For L levels in a multilevel method, the `seed_sequence` can be of any length and seeds will be assigned up to the number of values that are provided or up to the number of levels in the sequence. Thus, a `seed_sequence` of length 1 recovers the behavior of a scalar seed.

When `fixed_seed` is unspecified, the `seed_sequence` specification does not extend to the refinement of the sample set. For example, the value from the `seed_sequence` defines the initial sample set for a level, but then subsequent sample sets generated as data increments will allow the random number sequence to continue without resetting the seed value. This reflects the need to avoid reusing previous sample values when generating sample augmentations.

Examples

Defining a multilevel Monte Carlo in the following way

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 100 50 40 30 20
  seed_sequence = 1234 2345 3456 4567 5678
```

allows the reuse (via restart) of intermediate sample sets from other sources by matching the seed specifications for the targeted model resolutions.

See Also

These keywords may also be of interest:

- [seed](#)
- [fixed_seed](#)

7.2.60.10 fixed_seed

- [Keywords Area](#)

- [method](#)
- [approximate_control_variate](#)
- [fixed_seed](#)

Reuses the same seed value for multiple random sampling sets

Specification

Alias: none

Argument(s): none

Default: not fixed; pattern varies run-to-run

Description

The `fixed_seed` flag is relevant if multiple sampling sets will be generated over the course of a Dakota analysis. This occurs when using advance methods (e.g., surrogate-based optimization, optimization under uncertainty). The same seed value is reused for each of these multiple sampling sets, which can be important for reducing variability in the sampling results.

Default Behavior

The default behavior is to not use a fixed seed, as the repetition of the same sampling pattern can result in a modeling weakness that an optimizer could potentially exploit (resulting in actual reliabilities that are lower than the estimated reliabilities). For repeatable studies, the `seed` must also be specified.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    fixed_seed
```

7.2.60.11 sample_type

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [sample_type](#)

Selection of sampling strategy

Specification

Alias: none

Argument(s): none

Default: random

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Sample Type (Group 1)	lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
			random	Uses purely random Monte Carlo sampling to sample variables

Description

The `sample_type` keyword allows the user to select between two types of sampling: Monte Carlo (pure random) and Latin hypercube (stratified) sampling.

The incremental keywords are deprecated; instead use `samples` together with `refinement_samples`.

Default Behavior

If the `sample_type` keyword is present, it must be accompanied by `lhs` or `random`. In most contexts, `lhs` is the default (exception: `multilevel_sampling` uses Monte Carlo by default).

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
    seed = 83921
```

7.2.60.11.1 lhs

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [sample_type](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.60.11.2 random

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [sample_type](#)
- [random](#)

Uses purely random Monte Carlo sampling to sample variables

Specification

Alias: none

Argument(s): none

Description

The `random` keyword invokes Monte Carlo sampling as the means of drawing samples of uncertain variables according to their probability distributions.

Default Behavior

In most contexts, Monte Carlo sampling is not the default sampling mode (exception: `multilevel_sampling`). To change this behavior, the `random` keyword must be specified in conjunction with the `sample_type` keyword.

Usage Tips

Monte Carlo sampling is more computationally expensive than Latin Hypercube Sampling as it requires a larger number of samples to accurately estimate statistics.

Examples

```
method
  sampling
    sample_type random
    samples = 200
```

7.2.60.12 export_sample_sequence

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [export_sample_sequence](#)

Enable export of multilevel/multifidelity sample sequences to individual files

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

When this option is active, separate output files are written for each unique sample increment and are tagged by algorithm type, simulation interface, iteration count, level count, and the number of samples as described below. The data content is comprised of the input variables only, without corresponding responses, as an intended use case is to support evaluation of these sample sets offline.

Default Behavior

If not specified, the `annotated` format is assumed.

Expected Output

Separate output files are generated according to the following format: `{ml/cv}_{interface_id}_{iteration_number}_{level_number}_{number_of_samples}.dat`.

With respect to the algorithm type, interface id, and level counter, the following definitions are employed:

- Multilevel MC with hierarchical model: `ml_` is pre-pended for all sample increments and sample sets are tagged with the interface id from the HF model.
- Control Variate MC with hierarchical model (deprecated): `cv_` is prepended for all sample increments, shared sample sets are tagged with the HF interface id, and LF-only refinements are tagged by the LF interface id.
- Multilevel-Control Variate MC with hierarchical model: employs a combination of exports from the two cases above. `ml_` is pre-pended for all HF sample increments and sample sets are tagged with the interface id from the HF model; `cv_` is prepended for all LF increments and sample sets are tagged with the LF interface id. Note that the LF model shares the same `ml_` sample sets, but a redundant file is not created for this data.

- Non-hierarchical approaches (Multifidelity MC, Approximate Control Variate): `cv_` is prepended for all sample increments and sample sets are tagged with the corresponding model interface id. The level number corresponds to the index of the approximation model for LF increments and to the id of the truth model (number of LF approximations + 1) for shared increments.

With respect to iteration count, pilot samples are tagged with iteration 0.

Examples

The following method block

```
method,
  model_pointer = 'HIERARCH'
  multilevel_sampling
  pilot_samples = 20 seed = 1237
  convergence_tolerance = .01
  output silent
  export_sample_sequence
```

results in enabling the sample output of sample increments for each level to individual files using the default annotated format.

The following variables block

```
variables,
  id_variables = 'LF_VARS'
  uniform_uncertain = 7
  lower_bounds = 7*-1.
  upper_bounds = 7* 1.
  descriptors 'u1' 'u2' 'u3' 'u4' 'u5' 'u6' 'u7'
  discrete_state_set
  integer = 2
  num_set_values = 4 1
  set_values = 5 15 30 60 # number of spatial coords
                3      # number of Fourier solution modes
  initial_state = 5 3
  descriptors 'N_x' 'N_mod'
```

illustrates how to define descriptors for the variables. For this case, the descriptors `u1` through `u7`, `N_x`, and `N_mod` are reported in the sample files to help annotate the data.

7.2.60.12.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [export_sample_sequence](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

%eval_id	x1	x2	obj_fn	nl_n_ineq_con_1	nl_n_ineq_con_2
1	0.9	1.1	0.0002	0.26	0.76
2	0.90009	1.1	0.0001996404857	0.2601620081	0.759955

Default: annotated

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.60.12.3 freeform

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [export_sample_sequence](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.60.13 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [convergence_tolerance](#)

Stopping criterion based on relative error reduction

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration through satisfaction of a specified accuracy at minimum total cost.

For multilevel and multifidelity sampling methods, it is a **relative convergence tolerance** on the mean squared error (MSE), where the MSE is typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error).

The reference estimator variance is then defined as follows:

- Multilevel approaches (`multilevel_sampling` and `multilevel_multifidelity_sampling`): tolerance relative to initial multilevel Monte Carlo (MLMC) error after pilot sample
- Control variate approaches (`multifidelity_sampling` and `approximate_control_variate`): relative to Monte Carlo (MC) error from pilot sample where these are all initial estimator variances for the algorithm, recognizing that control variate approaches can extract no benefit from low-fidelity pilot samples prior to the definition of corresponding sample increments.

Permissible values are between 0 and 1, non-inclusive. Default value is 1.e-4.

7.2.60.14 `max_iterations`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: `fsu_cvt` , `local_reliability`: 25; `global_{reliability , interval_est , evidence}` / `efficient_global`: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

See Also

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.60.15 max_function_evaluations

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [max_function_evaluations](#)

Stopping criterion based on maximum function evaluations

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 1000

Description

For multilevel and multifidelity sampling methods, this specification provides a computational budget, indicating that the mean squared error (MSE) of the estimator is to be minimized within this budget. In these methods, the MSE is

typically comprised of known estimator variance (stochastic error), neglecting unknown residual bias (deterministic error for the highest-fidelity/most-resolved model).

The budget is provided in terms of the equivalent number of high-fidelity/fine-resolution evaluations. Default value is SZ_MAX (the maximum storable size_t), which is a special value indicating that a budget has not been specified.

7.2.60.16 final_statistics

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)

Indicate the type of final statistics to be returned by a UQ method

Specification

Alias: none

Argument(s): none

Default: qoi_statistics

Child Keywords:

	Required/Optional <i>Required (Choose One)</i>	Description of Group Final statistics type (Group 1)	Dakota Keyword estimator_performance	Dakota Keyword Description Return estimator performance as the final results of a UQ method
			qoi_statistics	Return the quantity of interest (QoI) statistics as the final results of a UQ method

Description

In nested execution contexts, an inner UQ method may return either a final set of QoI statistics (e.g., for optimization of moments or level mappings over design parameters within optimization under uncertainty) or a set of performance metrics (e.g., for maximization of performance over hyper-parameters within model tuning).

Default Behavior Return a final set of QoI statistics.

7.2.60.16.1 estimator_performance

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [estimator_performance](#)

Return estimator performance as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Description

Instead of QoI moments and level mappings, return the performance of the estimator in terms of its variance and aggregate cost. These metrics are targeted in the context of model tuning for multifidelity UQ methods.

Usage Tips Estimator variance can be minimized when total budget is specified. Alternatively, total budget can be minimized when estimator accuracy is specified. This is managed by the nested model response mappings that define the outer loop objective and constraints, sharing conceptual similarity to the RIA and PMA formulations for optimization with local reliability (refer to RBDO methods in the Theory Manual).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
    max_function_evaluations = 1000
    pilot_samples = 25
    seed = 8674132
    solution_mode pilot_projection
    final_statistics estimator_performance
```

7.2.60.16.2 qoi_statistics

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)

Return the quantity of interest (QoI) statistics as the final results of a UQ method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		final_moments	Output moments of the specified type and include them within the set of final statistics.

	Optional	distribution	Selection of cumulative or complementary cumulative functions
--	-----------------	------------------------------	---

Description

In most nested execution contexts, the outer loop is operating on the set of moments and level mappings returned by an inner loop UQ method. Thus `qoi_statistics` is the default.

Sub-specifications include the type of `final_moments` (`none`, `standard`, or `central`) and the sense of distribution functions (`cumulative` or `complementary`).

Examples

```
method,
  id_method = 'UQ'
  model_pointer = 'ENSEMBLE'
  multifidelity_sampling
    max_function_evaluations = 1000
    pilot_samples = 25
    seed = 8674132
  solution_mode online_pilot
  final_statistics qoi_statistics
```

7.2.60.16.2.1 final_moments

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)

Output moments of the specified type and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Default: standard

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Final moment type (Group 1)	none	Omit moments from the set of final statistics.

			standard	Select standard rejection
			central	Output central moments and include them within the set of final statistics.

Description

When performing a nested study that may employ moment statistics on the inner loop, it can be desirable to control the type of these moments. The `final_moments` specification supports options of `none`, `standard` (default), or `central`, corresponding to omission of moments, standardized moments (mean, standard deviation, skewness, and excess kurtosis), or central moments (mean, variance, 3rd central, and 4th central).

The presence or omission of moment results in the final statistics influences the outer level mappings in the case of a nested study. For example, `final_moments none` can allow for a more compact specification of primary and/or secondary response mappings.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments central
```

Overriding the default to `none` as follows:

```
method,
  sampling
    samples = 50 seed = 1234
    response_levels = 3.6e+11 1.2e+05 3.5e+05
    final_moments none
```

allows associated nested model mappings to be simplified from:

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 0. 0. 1. 0. 0. 1. 0. 0. 0.
    secondary_response_mapping = 0. 0. 0. 0. 0. 0. 0. 0. 1.
```

to a more compact version focused only on the response level mappings (two leading zeros per response function for moment mappings have been removed):

```
model
  nested
    sub_method_pointer = 'UQ'
    primary_response_mapping = 1. 1. 0.
    secondary_response_mapping = 0. 0. 1.
```

7.2.60.16.2.2 none

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)

- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [none](#)

Omit moments from the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

The omission of moment results from the final statistics can allow for a more compact definition of primary and/or secondary response mappings within a nested model specification.

Examples

```
method,  
  sampling  
    samples = 50 seed = 1234  
    response_levels = 3.6e+11 1.2e+05 3.5e+05  
    final_moments none
```

7.2.60.16.2.3 standard

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [standard](#)

Select standard rejection

Specification

Alias: none

Argument(s): none

Description

The use of a standard rejection approach in the Monte Carlo Markov Chain algorithm.

7.2.60.16.2.4 central

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [final_moments](#)
- [central](#)

Output central moments and include them within the set of final statistics.

Specification

Alias: none

Argument(s): none

Description

Output central moments (mean, variance, 3rd central, and 4th central) and include the first two within the set of final statistics to be used at a higher level (e.g., optimization under uncertainty, mixed aleatory-epistemic U-Q). This inclusion of moment results affects the primary and/or secondary response mappings in a nested model specification.

Examples

The following method specification overrides the default to print `central` moments and include them in the set of final statistics.

```
method,  
  sampling  
    samples = 50 seed = 1234  
    response_levels = 3.6e+11 1.2e+05 3.5e+05  
    final_moments central
```

7.2.60.16.2.5 distribution

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.60.16.2.6 cumulative

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.60.16.2.7 complementary

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [final_statistics](#)
- [qoi_statistics](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.60.17 rng

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.60.17.1 mt19937

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.60.17.2 rnum2

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.60.18 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [approximate_control_variate](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6
    sample_type lhs
    distribution cumulative

model
  id_model = 'SURR'
  surrogate global,

Importance sampling

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)
- [aleatory_uncertainty_quantification_methods](#)
- [sampling](#)

Specification

Alias: nond_importance_sampling

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		samples	Number of samples for sampling-based methods
	Optional		seed	Seed of the random number generator
	Required (<i>Choose One</i>)	Importance Sampling Approach (Group 1)	import	Importance sampling option for probability refinement
			adapt_import	Importance sampling option for probability refinement
			mm_adapt_import	Importance sampling option for probability refinement
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.
	Optional		max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods

	Optional	convergence_ - tolerance	Stopping criterion based on objective function or statistics convergence
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	gen_reliability_ - levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

The `importance_sampling` method is based on ideas in reliability modeling.

An initial Latin Hypercube sampling is performed to generate an initial set of samples. These initial samples are augmented with samples from an importance density as follows:

- The variables are transformed to standard normal space.
- In the transformed space, the importance density is a set of normal densities centered around points which are in the failure region.
- Note that this is similar in spirit to the reliability methods, in which importance sampling is centered around a Most Probable Point (MPP).
- In the case of the LHS samples, the importance sampling density will simply be a mixture of normal distributions centered around points in the failure region.

Options

Choose one of the importance sampling options:

- `import`

- `adapt_import`
- `mm_adapt_import`

The options for importance sampling are as follows: `import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). `adapt_import` is the same as `import` but is performed iteratively until the failure probability estimate converges. `mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

Theory

Importance sampling is a method that allows one to estimate statistical quantities such as failure probabilities (e.g. the probability that a response quantity will exceed a threshold or fall below a threshold value) in a way that is more efficient than Monte Carlo sampling. The core idea in importance sampling is that one generates samples that preferentially samples important regions in the space (e.g. in or near the failure region or user-defined region of interest), and then appropriately weights the samples to obtain an unbiased estimate of the failure probability [79]. In importance sampling, the samples are generated from a density which is called the importance density: it is not the original probability density of the input distributions. The importance density should be centered near the failure region of interest. For black-box simulations such as those commonly interfaced with Dakota, it is difficult to specify the importance density a priori: the user often does not know where the failure region lies, especially in a high-dimensional space. [81]. We have developed two importance sampling approaches which do not rely on the user explicitly specifying an importance density.

7.2.61.1 samples

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [samples](#)

Number of samples for sampling-based methods

Specification

Alias: initial_samples

Argument(s): INTEGER

Default: 0

Description

The `samples` keyword is used to define the number of samples (i.e., randomly chosen sets of variable values) at which to execute a model.

Default Behavior

By default, Dakota will use the minimum number of samples required by the chosen method.

Usage Tips

To obtain linear sensitivities or to construct a linear response surface, at least $\text{dim}+1$ samples should be used, where "dim" is the number of variables. For sensitivities to quadratic terms or quadratic response surfaces, at least $(\text{dim}+1)(\text{dim}+2)/2$ samples are needed. For uncertainty quantification, we recommend at least $10*\text{dim}$ samples. For `variance_based_decomp`, we recommend hundreds to thousands of samples. Note that for `variance_based_decomp`, the number of simulations performed will be $N*(\text{dim}+2)$.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.61.2 seed

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.61.3 import

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level).

7.2.61.4 adapt_import

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`adapt_import` centers a sampling density at one of the initial LHS samples identified in the failure region. It then generates the importance samples, weights them by their probability of occurrence given the original density, and calculates the required probability (CDF or CCDF level). This continues iteratively until the failure probability estimate converges.

7.2.61.5 `mm_adapt_import`

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [mm_adapt_import](#)

Importance sampling option for probability refinement

Specification

Alias: none

Argument(s): none

Description

`mm_adapt_import` starts with all of the samples located in the failure region to build a multimodal sampling density. First, it uses a small number of samples around each of the initial samples in the failure region. Note that these samples are allocated to the different points based on their relative probabilities of occurrence: more probable points get more samples. This early part of the approach is done to search for "representative" points. Once these are located, the multimodal sampling density is set and then `mm_adapt_import` proceeds similarly to `adapt_import` (sample until convergence).

7.2.61.6 `refinement_samples`

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the `initial_samples` in a sampling design.

7.2.61.7 `max_iterations`

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: `fsu_cvt` , `local_reliability`: 25; `global_{reliability , interval_est , evidence}` / `efficient_global`: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.61.8 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)
- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.61.9 response_levels

- [Keywords Area](#)
- [method](#)

- [importance_sampling](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds     = 199.3, 474.63
  upper_bounds     = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas           = 12., 30.
  betas            = 250., 590.
  descriptors      = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs        = 3 4
  abscissas        = 5 8 10 .1 .2 .3 .4
  counts           = 17 21 0 12 24 12 0
  descriptors      = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs        = 2
  abscissas        = 3 4
  counts           = 1 1
  descriptors      = 'TF3h'

interface,
  system_async_evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.61.9.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities,

both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.61.9.2 compute

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels

	Optional	system	Compute system reliability (series or parallel)
--	-----------------	------------------------	---

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.61.9.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.61.9.2.2 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.61.9.2.3 system

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group System Reliability Mode (Group 1)	Dakota Keyword series	Dakota Keyword Description Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.61.9.2.4 series

7.2.61.10 probability_levels

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
Optional		num_probability_levels	Specify which probability_levels correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'
```

```

uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors        = 'TF1u' 'TF2u'
weibull_uncertain = 2
  alphas            = 12., 30.
  betas             = 250., 590.
  descriptors        = 'TF1w' 'TF2w'

7.8702465755e+04	0.0000000000e+00		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
2.3796737090e+05	1.0000000000e+00		

3.6997214153e+05	3.0000000000e-01
3.8100966235e+05	2.0000000000e-01
4.4111498127e+05	0.0000000000e+00

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.61.10.1 num_probability_levels

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [probability_levels](#)
- [num_probability_levels](#)

Specify which `probability_levels` correspond to which response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: probability_levels evenly distributed among response functions

Description

See parent page

7.2.61.11 gen_reliability_levels

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [gen_reliability_levels](#)

Specify generalized reliability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_gen_reliability_levels	Specify which <code>gen_reliability_levels</code> correspond to which response

Description

Response levels are calculated for specified generalized reliabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.61.11.1 `num_gen_reliability_levels`

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [gen_reliability_levels](#)
- [num_gen_reliability_levels](#)

Specify which `gen_reliability_levels` correspond to which response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: `gen_reliability_levels` evenly distributed among response functions

Description

See parent page

7.2.61.12 distribution

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
```

```
sample_type lhs
samples = 10
distribution cumulative
```

7.2.61.12.1 cumulative

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
  sample_type lhs
  samples = 10
  distribution cumulative
```

7.2.61.12.2 complementary

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.61.13 rng

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister

			<code>rnum2</code>	Generates pseudo-random numbers using the Pecos package
--	--	--	--------------------	---

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.61.13.1 mt19937

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.61.13.2 rnum2

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.61.14 model_pointer

- [Keywords Area](#)
- [method](#)
- [importance_sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'
  surrogate global,
  dace_method_pointer = 'DACE'
  polynomial quadratic

method
  id_method = 'DACE'
  model_pointer = 'DACE_M'
  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'
```

```

variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system_async_evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses
  response_functions = 3
  no_gradients
  no_hessians

```

7.2.62 gpais

- [Keywords Area](#)
- [method](#)
- [gpais](#)

Gaussian Process Adaptive Importance Sampling

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)

Specification

Alias: gaussian_process_adaptive_importance_sampling

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		build_samples	Number of initial model evaluations used in build phase
	Optional		seed	Seed of the random number generator
	Optional		samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)

	Optional	import_build_points_file	File containing points you wish to use to build a surrogate
	Optional	export_approx_points_file	Output file for surrogate model value evaluations
	Optional	max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

`gpais` is recommended for problems that have a relatively small number of input variables (e.g. less than 10-20). This method, Gaussian Process Adaptive Importance Sampling, is outlined in the paper [?].

This method starts with an initial set of LHS samples and adds samples one at a time, with the goal of adaptively improving the estimate of the ideal importance density during the process. The approach uses a mixture of component densities. An iterative process is used to construct the sequence of improving component densities. At each iteration, a Gaussian process (GP) surrogate is used to help identify areas in the space where failure is likely to occur. The GPs are not used to directly calculate the failure probability; they are only used to approximate the importance density. Thus, the Gaussian process adaptive importance sampling algorithm overcomes limitations involving using a potentially inaccurate surrogate model directly in importance sampling calculations.

7.2.62.1 build_samples

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: samples

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.62.2 seed

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.62.3 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: none

Argument(s): INTEGER

Default: 10000

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.62.4 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

		freeform	Selects freeform file format
	Optional	active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.62.4.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```

%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9        1.1         0.0002         0.26           0.76
2             0.90009    1.1 0.0001996404857  0.2601620081   0.759955
3             0.89991    1.1 0.0002003604863  0.2598380081   0.760045
...

```

7.2.62.4.2 annotated

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.62.4.3 freeform

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.62.5 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

			freeform	Selects freeform file format
--	--	--	--------------------------	------------------------------

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.62.5.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file

	Optional	eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional	interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether header row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) annotated.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.62.5.2 annotated

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [export_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.

- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955

...
```

7.2.62.5.3 freeform

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [export_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009        1.1 0.0001996404857  0.2601620081  0.759955
0.89991        1.1 0.0002003604863  0.2598380081  0.760045
...

```

7.2.62.6 max_iterations

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: `fsu_cvt` , `local_reliability`: 25; `global_{reliability , interval_est , evidence}` / `efficient_global`: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.62.7 response_levels

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means             = 248.89, 593.33
  std_deviations    = 12.4, 29.7
  descriptors       = 'TF1n' 'TF2n'

4.0000000000e+05	4.5000000000e+05	1.8000000000e-06

Level mappings for each response function:

Complementary Cumulative Distribution Function (CCDF) for response_fn_1:

Response Level	Probability Level	Reliability Index	General Rel Index
3.6000000000e+11	5.5000000000e-01		
4.0000000000e+11	3.8000000000e-01		
4.4000000000e+11	2.3000000000e-01		

Complementary Cumulative Distribution Function (CCDF) for response_fn_2:

Response Level	Probability Level	Reliability Index	General Rel Index
6.0000000000e+04	6.1000000000e-01		
6.5000000000e+04	2.9000000000e-01		
7.0000000000e+04	9.0000000000e-02		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
3.5000000000e+05	5.2000000000e-01		
4.0000000000e+05	9.0000000000e-02		
4.5000000000e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.62.7.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.62.7.2 compute

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Statistics to Compute (Group 1)	Dakota Keyword probabilities	Dakota Keyword Description Computes probabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.62.7.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.62.7.2.2 gen_reliabilities

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
  complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
  compute gen_reliabilities
```

7.2.62.7.2.3 system

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_probability_levels	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not

very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
    1. .8 .5 0.
    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means = 248.89, 593.33
  std_deviations = 12.4, 29.7
  descriptors = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds = 199.3, 474.63
  upper_bounds = 298.5, 712.
  descriptors = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas = 12., 30.
  betas = 250., 590.
  descriptors = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs = 3 4
  abscissas = 5 8 10 .1 .2 .3 .4
  counts = 17 21 0 12 24 12 0
  descriptors = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs = 2
  abscissas = 3 4
  counts = 1 1
  descriptors = 'TF3h'

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values that correspond the probability levels specified in the input file. Those response values are also shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

```

2.3796737090e+05	1.0000000000e+00		
3.6997214153e+05	3.0000000000e-01		
3.8100966235e+05	2.0000000000e-01		
4.4111498127e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.62.8.1 num_probability_levels

7.2.62.10 distribution

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional <i>Required (Choose One)</i>	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword	Dakota Keyword Description
			cumulative	Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.62.10.1 cumulative

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.62.10.2 complementary

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.62.11 rng

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.62.11.1 mt19937

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.62.11.2 rnum2

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.62.12 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [gpais](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
  samples = 10
  seed = 98765 rng rnum2
  response_levels = 0.1 0.2 0.6
                   0.1 0.2 0.6
                   0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'
```

```
    surrogate global,  
    dace_method_pointer = 'DACE'  
    polynomial quadratic  
  
method  
  id_method = 'DACE'  
  model_pointer = 'DACE_M'  
  sampling sample_type lhs  
  samples = 121 seed = 5034 rng rnum2  
  
model  
  id_model = 'DACE_M'  
  single  
  interface_pointer = 'I1'  
  
variables  
  uniform_uncertain = 2  
  lower_bounds = 0.  0.  
  upper_bounds = 1.  1.  
  descriptors = 'x1' 'x2'  
  
interface  
  id_interface = 'I1'  
  system async evaluation_concurrency = 5  
  analysis_driver = 'text_book'  
  
responses  
  response_functions = 3  
  no_gradients  
  no_hessians
```

7.2.63 adaptive_sampling

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)

(Experimental) Adaptively refine a Gaussian process surrogate

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)

Specification

Alias: nond_adaptive_sampling

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		initial_samples	Initial number of samples for sampling-based methods
	Optional		seed	Seed of the random number generator
	Optional		samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional		fitness_metric	(Experimental) Specify the <code>fitness_metric</code> used to select the next point
	Optional		batch_selection	(Experimental) How to select new points
	Optional		refinement_samples	Number of samples used to refine a probability estimate or sampling design.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations
	Optional		misc_options	(Experimental) Hook for algorithm-specific adaptive sampling options

	Optional	max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

This is an experimental capability that is not ready for production use at this point. It was part of an investigation into computational topology-based approaches to feature identification and surrogate refinement.

The goal in performing adaptive sampling is to construct a surrogate model that can be used as an accurate predictor to some expensive simulation, thus it is to one's advantage to build a surrogate that minimizes the error over the entire domain of interest using as little data as possible from the expensive simulation. The adaptive part alludes to the fact that the surrogate will be refined by focusing samples of the expensive simulation on particular areas of interest rather than rely on random selection or standard space-filling techniques.

At a high-level, the adaptive sampling pipeline is a four-step process:

- Evaluate the expensive simulation (referred to as the true model) at initial sample point
 1. Fit a surrogate model
 2. Create a candidate set and score based on information from surrogate
 3. Select a candidate point to evaluate the true model
 4. Loop until done

In terms of the Dakota implementation, the adaptive sampling method currently uses Latin Hypercube sampling (LHS) to generate the initial points in Step 1 above. For Step 2, we use a Gaussian process model.

The default behavior is to add one point at a time. At each iteration (e.g. each loop of Steps 2-4 above), a Latin Hypercube sample is generated (a new one, different from the initial sample) and the surrogate model is evaluated at this points. These are the candidate points that are then evaluated according to the fitness metric. The number of candidates used in practice should be high enough to fill most of the input domain: we recommend at least hundreds of points for a low-dimensional problem. All of the candidates (samples on the emulator) are given a score and then the highest-scoring candidate is selected to be evaluated on the true model.

The adaptive sampling method also can generate batches of points to add at a time using the `batch_selection` and `batch_size` keywords.

7.2.63.1 initial_samples

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [initial_samples](#)

Initial number of samples for sampling-based methods

Specification

Alias: samples

Argument(s): INTEGER

Default: 0

Description

The `initial_samples` keyword is used to define the number of initial samples (i.e., randomly chosen sets of variable values) at which to execute a model. The initial samples may later be augmented in an iterative process.

Default Behavior

By default, Dakota will use the minimum number of samples required by the chosen method.

Usage Tips

To obtain linear sensitivities or to construct a linear response surface, at least $\text{dim}+1$ samples should be used, where "dim" is the number of variables. For sensitivities to quadratic terms or quadratic response surfaces, at least

$(dim+1)(dim+2)/2$ samples are needed. For uncertainty quantification, we recommend at least $10 \cdot dim$ samples. For `variance_based_decomp`, we recommend hundreds to thousands of samples. Note that for `variance_based_decomp`, the number of simulations performed will be $N \cdot (dim+2)$.

Examples

```
method
  sampling
    sample_type random
    initial_samples = 20
    refinement_samples = 5
```

7.2.63.2 seed

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.63.3 `samples_on_emulator`

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: none

Argument(s): INTEGER

Default: 400

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.63.4 `fitness_metric`

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [fitness_metric](#)

(Experimental) Specify the `fitness_metric` used to select the next point

Specification

Alias: none

Argument(s): none

Default: `predicted_variance`

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Fitness Metric (Group 1)	predicted_variance	Pick points with highest variance
			distance	Space filling metric
			gradient	Fill the range space of the surrogate

Description

`adaptive` sampling is an experimental capability that is not ready for production use at this time.

The user can specify the `fitness_metric` used to select the next point (or points) to evaluate and add to the set. The fitness metrics used for scoring candidate points include:

- `predicted_variance`
- `distance`
- `gradient`

7.2.63.4.1 `predicted_variance`

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [fitness_metric](#)
- [predicted_variance](#)

Pick points with highest variance

Specification

Alias: none

Argument(s): none

Description

The predicted variance metric uses the predicted variance of the Gaussian process surrogate as the score of a candidate point. Thus, the adaptively chosen points will be in areas of highest uncertainty according to the Gaussian process model.

7.2.63.4.2 `distance`

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [fitness_metric](#)
- [distance](#)

Space filling metric

Specification

Alias: none

Argument(s): none

Description

The distance metric calculates the Euclidean distance in domain space between the candidate and its nearest neighbor in the set of points already evaluated on the true model. Therefore, the most undersampled area of the domain will always be selected. Note that this is a space-filling metric.

7.2.63.4.3 gradient

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [fitness_metric](#)
- [gradient](#)

Fill the range space of the surrogate

Specification

Alias: none

Argument(s): none

Description

The gradient metric calculates the score as the absolute value of the difference in range space (the outputs) of the two points. The output values used are predicted from the surrogate model. This method attempts to evenly fill the range space of the surrogate.

7.2.63.5 batch_selection

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [batch_selection](#)

(Experimental) How to select new points

Specification

Alias: none

Argument(s): none

Default: naive

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (Choose One)	Batch Selection Criterion (Group 1)	naive	Take the highest scoring candidates
			distance_penalty	Add a penalty to spread out the points in the batch
			topology	In this selection strategy, we use information about the topology of the space from the Morse-Smale complex to identify next points to select.
			constant_liar	Use information from the existing surrogate model to predict what the surrogate upgrade will be with new points.

Description

`adaptive_sampling` is an experimental capability that is not ready for production use at this time.

With batch or multi-point selection, the true model can be evaluated in parallel and thus increase throughput before refitting our surrogate model. This proposes a new challenge as the problem of choosing a single point and choosing multiple points off a surrogate are fundamentally different. Selecting the n best scoring candidates is more than likely to generate a set of points clustered in one area which will not be conducive to adapting the surrogate.

We have implemented several strategies for batch selection of points. These are described in the User's manual and are the subject of active research.

The `batch_selection` strategies include:

1. `naive`:
2. `distance_penalty`
3. `constant_liar`
4. `topology`

7.2.63.5.1 naive

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [batch_selection](#)
- [naive](#)

Take the highest scoring candidates

Specification

Alias: none

Argument(s): none

Description

This strategy will select the n highest scoring candidates regardless of their position. This tends to group an entire round of points in the same area.

7.2.63.5.2 distance_penalty

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [batch_selection](#)
- [distance_penalty](#)

Add a penalty to spread out the points in the batch

Specification

Alias: none

Argument(s): none

Description

In this strategy, the highest scoring candidate is selected and then all remaining candidates are re-scored with a distance penalization factor added in to the score.

7.2.63.5.3 topology

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [batch_selection](#)
- [topology](#)

In this selection strategy, we use information about the topology of the space from the Morse-Smale complex to identify next points to select.

Specification

Alias: none

Argument(s): none

Description

In this strategy we look at the topology of the scoring function and select the n highest maxima in the topology. To determine local maxima, we construct the approximate Morse-Smale complex. This strategy does require the user to have the Morse-Smale package.

7.2.63.5.4 constant_liar

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [batch_selection](#)
- [constant_liar](#)

Use information from the existing surrogate model to predict what the surrogate upgrade will be with new points.

Specification

Alias: none

Argument(s): none

Description

The strategy first selects the highest scoring candidate, and then refits the surrogate using a "lie" value at the point selected. The 'lie' value is based on the surrogate predictions and not the simulation. This process repeats until n points have been selected whereupon the lie values are removed from the surrogate and the selected points are evaluated on the true model and the surrogate is refit with these values.

7.2.63.6 refinement_samples

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [refinement_samples](#)

Number of samples used to refine a probability estimate or sampling design.

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Probability estimate: Specify the (scalar) number of samples used to improve a probability estimate. If using uni-modal sampling all samples are assigned to the sampling center. If using multi-modal sampling the samples are split between multiple samples according to some internally computed weights.

Sampling design: Specify one or a sequence of refinement samples to augment the initial_samples in a sampling design.

7.2.63.7 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.63.7.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857  0.2601620081  0.759955
3              0.89991      1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.63.7.1.1 header

7.2.63.7.2 annotated

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009    1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991    1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.63.7.3 freeform

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009        1.1 0.0001996404857  0.2601620081  0.759955
0.89991        1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.63.7.4 active_only

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.63.8 export_approx_points_file

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: export_points_file

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.63.8.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

7.2.63.9 misc_options

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [misc_options](#)

(Experimental) Hook for algorithm-specific adaptive sampling options

Specification

Alias: none

Argument(s): STRINGLIST

Default: no misc options

Description

The adaptive sampling algorithm is an experimental capability and not ready for production use at this time.

7.2.63.10 max_iterations

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: fsu_cvt , local_reliability: 25; global_{reliability , interval_est , evidence} / efficient_global: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.63.11 response_levels

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04

```

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.63.11.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.63.11.2 compute

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels

			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.63.11.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.63.11.2.2 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05
  compute gen_reliabilities
```

7.2.63.11.2.3 system

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.63.11.2.4 series

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [series](#)

Aggregate response statistics assuming a series system

Specification

Alias: none

Argument(s): none

Description

See parent keyword `system` for description.

7.2.63.11.2.5 parallel

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [parallel](#)

Aggregate response statistics assuming a parallel system

Specification

Alias: none

Argument(s): none

Description

See parent keyword `system` for description.

7.2.63.12 probability_levels

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_probability_levels	Specify which probability_levels correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
```

```

uniform_uncertain = 2
  lower_bounds      = 199.3, 474.63
  upper_bounds      = 298.5, 712.
  descriptors        = 'TF1u' 'TF2u'
weibull_uncertain = 2
  alphas            = 12., 30.
  betas              = 250., 590.
  descriptors        = 'TF1w' 'TF2w'
histogram_bin_uncertain = 2
  num_pairs         = 3      4
  abscissas         = 5 8 10 .1 .2 .3 .4
  counts            = 17 21 0 12 24 12 0
  descriptors        = 'TF1h' 'TF2h'
histogram_point_uncertain
  real = 1
  num_pairs         = 2
  abscissas         = 3 4
  counts            = 1 1
  descriptors        = 'TF3h'

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians

```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values that correspond the probability levels specified in the input file. Those response values are also shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.63.12.1 num_probability_levels

7.2.63.14 distribution

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
```

```
sample_type lhs
samples = 10
distribution cumulative
```

7.2.63.14.1 cumulative

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.63.14.2 complementary

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.63.15 rng

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister

			<code>rnum2</code>	Generates pseudo-random numbers using the Pecos package
--	--	--	--------------------	---

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.63.15.1 mt19937

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.63.15.2 rnum2

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.63.16 model_pointer

- [Keywords Area](#)
- [method](#)
- [adaptive_sampling](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'
  surrogate global,
  dace_method_pointer = 'DACE'
  polynomial quadratic

method
  id_method = 'DACE'
  model_pointer = 'DACE_M'
  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'
```

```

variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system_async_evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses
  response_functions = 3
  no_gradients
  no_hessians

```

7.2.64 pof_darts

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)

Probability-of-Failure (POF) darts is a novel method for estimating the probability of failure based on random sphere-packing.

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)

Specification

Alias: nond_pof_darts

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		build_samples	Number of initial model evaluations used in build phase
	Optional		seed	Seed of the random number generator
	Optional		lipschitz	Select the type of Lipschitz estimation (global or local)
	Optional		samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)

	Optional	response_levels	Values at which to estimate desired statistics for each response
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Selection of a random number generator
	Optional	model_pointer	Identifier for model block to be used by a method

Description

`pof_darts` is a novel method for estimating the probability of failure based on random sphere-packing. Random spheres are sampled from the domain with the constraint that each new sphere center has to be outside prior disks. The radius of each sphere is chosen such that the entire sphere lie either in the failure or the non-failure region. This radius depends of the function evaluation at the disk center, the failure threshold and an estimate of the function gradient at the disk center.

We utilize a global surrogate for evaluating the gradient and hence only one function evaluation is required for each sphere.

After exhausting the sampling budget specified by `samples`, which is the number of spheres per failure threshold, the domain is decomposed into two regions. These regions correspond to failure and non-failure, each represented by the union of the spheres of each type. The volume of the union of failure spheres gives a lower bound on the required estimate of the probability of failure, while the volume of the union of the non-failure spheres subtracted from the volume of the domain gives an upper estimate. We currently report the average of both estimates.

`pof_darts` handles multiple response functions and allows each to have multiple failure thresholds. For each failure threshold, `pof_darts` will insert a number of spheres specified by the user-input parameter `samples`.

However, estimating the probability of failure for each failure threshold would utilize the total number of disks sampled for all failure thresholds. For each failure threshold, the sphere radii changes to generate the right spatial decomposition.

7.2.64.1 `build_samples`

- [Keywords Area](#)
- [method](#)

- [pof_darts](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: samples

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.64.2 seed

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.64.3 lipschitz

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [lipschitz](#)

Select the type of Lipschitz estimation (global or local)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Local/Global Estimate (Group 1)	Dakota Keyword local	Dakota Keyword Description Specify local estimation of the Lipschitz constant
			global	Specify global estimation of the Lipschitz estimate

Description

There are two types of Lipschitz estimation used in sizing the disks used in POF Darts: `global` and `local`. The global approach uses one Lipschitz estimate for the entire domain. The local approach calculates the Lipschitz estimate separately for each Voronoi region based on nearby points. The local method is more expensive but more accurate.

7.2.64.3.1 local

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [lipschitz](#)
- [local](#)

Specify local estimation of the Lipschitz constant

Specification

Alias: none

Argument(s): none

Description

The local approach to estimate the Lipschitz constant calculates the Lipschitz estimate separately for each Voronoi region based on nearby points. The local method is more expensive but results in higher accuracy compared to the global method.

7.2.64.3.2 global

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [lipschitz](#)
- [global](#)

Specify global estimation of the Lipschitz estimate

Specification

Alias: none

Argument(s): none

Description

The global approach uses one Lipschitz estimate for the entire domain. This option is currently deactivated. Please refer to the local alternative.

7.2.64.4 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)

- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: none

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.64.5 response_levels

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response

	Optional	<code>compute</code>	Selection of statistics to compute at each response level
--	-----------------	----------------------	---

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations   = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds     = 199.3, 474.63
```

```

    upper_bounds      = 298.5, 712.
    descriptors       = 'TF1u' 'TF2u'
weibull_uncertain = 2
    alphas           = 12., 30.
    betas            = 250., 590.
    descriptors       = 'TF1w' 'TF2w'
histogram_bin_uncertain = 2
    num_pairs        = 3 4
    abscissas        = 5 8 10 .1 .2 .3 .4
    counts           = 17 21 0 12 24 12 0
    descriptors       = 'TF1h' 'TF2h'
histogram_point_uncertain
    real = 1
    num_pairs        = 2
    abscissas        = 3 4
    counts           = 1 1
    descriptors       = 'TF3h'

interface,
    system asynch evaluation_concurrency = 5
    analysis_driver = 'text_book'

responses,
    response_functions = 3
    no_gradients
    no_hessians

```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Bin Lower	Bin Upper	Density Value
2.7604749078e+11	3.6000000000e+11	5.3601733194e-12
3.6000000000e+11	4.0000000000e+11	4.2500000000e-12
4.0000000000e+11	4.4000000000e+11	3.7500000000e-12
4.4000000000e+11	5.4196114379e+11	2.2557612778e-12

PDF for response_fn_2:

Bin Lower	Bin Upper	Density Value
4.6431154744e+04	6.0000000000e+04	2.8742313192e-05
6.0000000000e+04	6.5000000000e+04	6.4000000000e-05
6.5000000000e+04	7.0000000000e+04	4.0000000000e-05
7.0000000000e+04	7.8702465755e+04	1.0341896485e-05

PDF for response_fn_3:

Bin Lower	Bin Upper	Density Value
2.3796737090e+05	3.5000000000e+05	4.2844660868e-06
3.5000000000e+05	4.0000000000e+05	8.6000000000e-06
4.0000000000e+05	4.5000000000e+05	1.8000000000e-06

Level mappings for each response function:

Complementary Cumulative Distribution Function (CCDF) for response_fn_1:

Response Level	Probability Level	Reliability Index	General Rel Index
3.6000000000e+11	5.5000000000e-01		
4.0000000000e+11	3.8000000000e-01		
4.4000000000e+11	2.3000000000e-01		

Complementary Cumulative Distribution Function (CCDF) for response_fn_2:

Response Level	Probability Level	Reliability Index	General Rel Index
6.0000000000e+04	6.1000000000e-01		
6.5000000000e+04	2.9000000000e-01		
7.0000000000e+04	9.0000000000e-02		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
3.5000000000e+05	5.2000000000e-01		
4.0000000000e+05	9.0000000000e-02		
4.5000000000e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.64.5.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.64.5.2 compute

- [Keywords Area](#)
- [method](#)

- [pof_darts](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional	Description of Group Statistics to Compute (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		probabilities	Computes probabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, `probabilities` will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
```

```

sample_type random
samples = 100 seed = 1
complementary distribution
response_levels = 3.6e+11 4.0e+11 4.4e+11
                  6.0e+04 6.5e+04 7.0e+04
                  3.5e+05 4.0e+05 4.5e+05
compute reliabilities

```

7.2.64.5.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```

method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities

```

7.2.64.5.2.2 gen_reliabilities

- [Keywords Area](#)
- [method](#)

- [pof_darts](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
  complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
  compute gen_reliabilities
```

7.2.64.5.2.3 system

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	System Reliability Mode (Group 1)	series	Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.64.5.2.4 series

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)
- [compute](#)
- [system](#)
- [series](#)

Aggregate response statistics assuming a series system

Description

See parent keyword `system` for description.

7.2.64.5.2.5 parallel

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [response_levels](#)

- [compute](#)
- [system](#)
- [parallel](#)

Aggregate response statistics assuming a parallel system

Specification

Alias: none

Argument(s): none

Description

See parent keyword `system` for description.

7.2.64.6 `probability_levels`

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_probability_levels	Specify which <code>probability_levels</code> correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not

very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
    1. .8 .5 0.
    1. .3 .2 0.

variables,
  normal_uncertain = 2

  alphas = 12., 30.
  betas = 250., 590.
  descriptors = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs = 3 4
  abscissas = 5 8 10 .1 .2 .3 .4
  counts = 17 21 0 12 24 12 0
  descriptors = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs = 2
  abscissas = 3 4
  counts = 1 1
  descriptors = 'TF3h'

interface,
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values that correspond the probability levels specified in the input file. Those response values are also shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

Bin Lower	Bin Upper	Density Value
2.7604749078e+11	3.4221494996e+11	5.1384774972e-12

4.4111498127e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.64.6.1 num_probability_levels

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [probability_levels](#)
- [num_probability_levels](#)

Specify which `probability_levels` correspond to which response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: `probability_levels` evenly distributed among response functions

Description

See parent page

7.2.64.7 gen_reliability_levels

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [gen_reliability_levels](#)

Specify generalized reliability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_gen_reliability_levels	Specify which gen_reliability_levels correspond to which response

Description

Response levels are calculated for specified generalized reliabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.64.7.1 num_gen_reliability_levels

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)

- [gen_reliability_levels](#)
- [num_gen_reliability_levels](#)

Specify which `gen_reliability_levels` correspond to which response

Specification

Argument(s): INTEGERLIST

Default: `gen_reliability_levels` evenly distributed among response functions

Description

See parent page

7.2.64.8 distribution

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional <i>Required (Choose One)</i>	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword	Dakota Keyword Description
			cumulative	Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.64.8.1 cumulative

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.64.8.2 complementary

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.64.9 rng

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.64.9.1 mt19937

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.64.9.2 rnum2

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.64.10 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [pof_darts](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
  samples = 10
  seed = 98765 rng rnum2
  response_levels = 0.1 0.2 0.6
                   0.1 0.2 0.6
                   0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'
```

```

    surrogate global,
    dace_method_pointer = 'DACE'
    polynomial quadratic

method
  id_method = 'DACE'
  model_pointer = 'DACE_M'
  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'

variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system async evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses
  response_functions = 3
  no_gradients
  no_hessians

```

7.2.65 rkd_darts

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)

Recursive k-d (RKD) Darts: Recursive Hyperplane Sampling for Numerical Integration of High-Dimensional Functions.

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)

Specification

Alias: nond_rkd_darts

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		build_samples	Number of initial model evaluations used in build phase

	Optional	seed	Seed of the random number generator
	Optional	lipschitz	Undocumented: Recursive k-d (RKD) Darts is an experimental capability.
	Optional	samples_on_emulator	Number of samples at which to evaluate an emulator (surrogate)
	Optional	response_levels	Undocumented: Recursive k-d (RKD) Darts is an experimental capability.
	Optional	probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional	gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional	distribution	Selection of cumulative or complementary cumulative functions
	Optional	rng	Undocumented: Recursive k-d (RKD) Darts is an experimental capability.
	Optional	model_pointer	Identifier for model block to be used by a method

Description

Disclaimer: The RKD method is currently in development mode, for further experimental verification. Please contact Dakota team if you have further questions about using this method.

Recursive k-d (RKD) darts is an algorithm to evaluate the integration of a d-dimensional black box function $f(x)$ via recursive sampling over d , using a series of hyperplanes of variable dimensionality $k = \{d, d-1, \dots, 0\}$. Fundamentally, we decompose the d-dimensional integration problem into a series of nested one-dimensional problems. That is, we start at the root level (the whole domain) and start sampling down using hyperplanes of one lower dimension, all the way down to zero (points). A d-dimensional domain is subsampled using (d-1) hyperplanes, a (d-1)-dimensional sub-domain is subsampled using (d-2) hyperplanes, and so on. Every hyperplane, regardless of its dimension, is evaluated using sampled hyperplanes of one lower dimension, as shown in the set of figures above. Each hyperplane has direct information exchange with its parent hyperplane of one higher dimension, and its children of one lower dimension.

In each one-dimensional problem, we construct a piecewise approximation surrogate model, using 1-dimensional Lagrange interpolation. Information is exchanged between different levels, including integration values, as well as interpolation and evaluation errors, in order to a) find the integration value up to that level, b) estimate the associated integration error, and c) guide the placement of future samples.

7.2.65.1 `build_samples`

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: `samples`

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.65.2 `seed`

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.65.3 lipschitz

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [lipschitz](#)

Undocumented: Recursive k-d (RKD) Darts is an experimental capability.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Local/Global Estimate (Group 1)	local	Undocumented: Recursive k-d (RKD) Darts is an experimental capability.
			global	Undocumented: Recursive k-d (RKD) Darts is an experimental capability.

7.2.65.3.1 local

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [lipschitz](#)
- [local](#)

Undocumented: Recursive k-d (RKD) Darts is an experimental capability.

Specification

Alias: none

Argument(s): none

7.2.65.3.2 global

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [lipschitz](#)
- [global](#)

Undocumented: Recursive k-d (RKD) Darts is an experimental capability.

Specification

Alias: none

Argument(s): none

7.2.65.4 samples_on_emulator

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)

- [samples_on_emulator](#)

Number of samples at which to evaluate an emulator (surrogate)

Specification

Alias: none

Argument(s): INTEGER

Description

How many approximate function evaluations to perform on the emulator model, e.g., to compute statistics

Default Behavior

The default number of samples is method-dependent.

Examples

Perform 10000 samples on the PCE approximation of the true model:

```
method
  polynomial_chaos
    quadrature_order = 2
    samples_on_emulator = 10000
```

7.2.65.5 response_levels

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)

Undocumented: Recursive k-d (RKD) Darts is an experimental capability.

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_response_levels	Number of values at which to estimate desired statistics for each response
	Optional		compute	Selection of statistics to compute at each response level

7.2.65.5.1 [num_response_levels](#)

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: [response_levels](#) evenly distributed among response functions

Description

The [num_response_levels](#) keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If [num_response_levels](#) is not specified, the [response_levels](#) will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.65.5.2 compute

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Statistics to Compute (Group 1)	Dakota Keyword probabilities	Dakota Keyword Description Computes probabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels
	Optional		system	Compute system reliability (series or parallel)

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, `probabilities` will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
                     3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.65.5.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                     6.0e+04 6.5e+04 7.0e+04
                     3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.65.5.2.2 gen_reliabilities

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute gen_reliabilities
```

7.2.65.5.2.3 system

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [response_levels](#)
- [compute](#)
- [system](#)

Compute system reliability (series or parallel)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional <i>Required (Choose One)</i>	Description of Group System Reliability Mode (Group 1)	Dakota Keyword	Dakota Keyword Description
			series	Aggregate response statistics assuming a series system
			parallel	Aggregate response statistics assuming a parallel system

Description

With the system probability/reliability option, statistics for specified `response_levels` are calculated and reported assuming the response functions combine either in series or parallel to produce a total system response.

For a series system, the system fails when any one component (response) fails. The probability of failure is the complement of the product of the individual response success probabilities.

For a parallel system, the system fails only when all components (responses) fail. The probability of failure is the product of the individual response failure probabilities.

7.2.65.6 probability_levels

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_probability_levels	Specify which probability_levels correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds    = 199.3, 474.63
  upper_bounds    = 298.5, 712.
  descriptors      = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas          = 12., 30.
  betas           = 250., 590.
  descriptors      = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs       = 3 4
  abscissas       = 5 8 10 .1 .2 .3 .4

4.4111498127e+05	0.0000000000e+00		

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.65.8 distribution

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Distribution Type (CDF/CCDF) (Group 1)	cumulative	Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.65.8.1 cumulative

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.65.8.2 complementary

- [Keywords Area](#)

7.2.65.10 `model_pointer`

- [Keywords Area](#)
- [method](#)
- [rkd_darts](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
  samples = 10
  seed = 98765 rng rnum2
  response_levels = 0.1 0.2 0.6
                   0.1 0.2 0.6
                   0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

- [method](#)
- [global_evidence](#)

Evidence theory with evidence measures computed with global optimization methods

Topics

This keyword is related to the topics:

- [epistemic_uncertainty_quantification_methods](#)
- [evidence_theory](#)

Specification

Alias: nond_global_evidence

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		samples	Number of samples for sampling-based methods
	Optional		seed	Seed of the random number generator
	Optional (<i>Choose One</i>)	Solution Approach (Group 1)	sbgo	Use the surrogate based optimization method
			ego	Use the Efficient Global Optimization method
			ea	Use an evolutionary algorithm
			lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
	Optional		response_levels	Values at which to estimate desired statistics for each response
	Optional		probability_levels	Specify probability levels at which to estimate the corresponding response value
	Optional		gen_reliability_levels	Specify generalized reliability levels at which to estimate the corresponding response value
	Optional		distribution	Selection of cumulative or complementary cumulative functions
	Optional		rng	Selection of a random number generator
	Optional		model_pointer	Identifier for model block to be used by a method

Description

`global_evidence` allows the user to specify several global approaches for calculating the belief and plausibility functions:

- `lhs` - note: this takes the minimum and maximum of the samples as the bounds per "interval cell combination."
- `ego` - uses Efficient Global Optimization which is based on an adaptive Gaussian process surrogate.
- `sbo` - uses a Gaussian process surrogate (non-adaptive) within an optimization process.
- `ea` - uses an evolutionary algorithm. This can be expensive as the `ea` will be run for each interval cell combination.

Note that to calculate the plausibility and belief cumulative distribution functions, one has to look at all combinations of intervals for the uncertain variables. In terms of implementation, if one is using LHS sampling as outlined above, this method creates a large sample over the response surface, then examines each cell to determine the minimum and maximum sample values within each cell. To do this, one needs to set the number of samples relatively high: the default is 10,000 and we recommend at least that number. If the model you are running is a simulation that is computationally quite expensive, we recommend that you set up a surrogate model within the Dakota input file so that `global_evidence` performs its sampling and calculations on the surrogate and not on the original model. If one uses optimization methods instead to find the minimum and maximum sample values within each cell, this can also be computationally expensive.

Additional Resources

See the topic page [evidence_theory](#) for important background information and usage notes.

Refer to [variable_support](#) for information on supported variable types.

Theory

The basic idea is that one specifies an "evidence structure" on uncertain inputs and propagates that to obtain belief and plausibility functions on the response functions. The inputs are defined by sets of intervals and Basic Probability Assignments (BPAs). Evidence propagation is computationally expensive, since the minimum and maximum function value must be calculated for each "interval cell combination." These bounds are aggregated into belief and plausibility.

7.2.66.1 samples

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)

- [samples](#)

Number of samples for sampling-based methods

Specification

Alias: none

Argument(s): INTEGER

Description

The `samples` keyword is used to define the number of samples (i.e., randomly chosen sets of variable values) at which to execute a model.

Default Behavior

By default, Dakota will use the minimum number of samples required by the chosen method.

Usage Tips

To obtain linear sensitivities or to construct a linear response surface, at least $\text{dim}+1$ samples should be used, where "dim" is the number of variables. For sensitivities to quadratic terms or quadratic response surfaces, at least $(\text{dim}+1)(\text{dim}+2)/2$ samples are needed. For uncertainty quantification, we recommend at least $10*\text{dim}$ samples. For `variance_based_decomp`, we recommend hundreds to thousands of samples. Note that for `variance_based_decomp`, the number of simulations performed will be $N*(\text{dim}+2)$.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.66.2 seed

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.66.3 sbgo

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)

Use the surrogate based optimization method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		gaussian_process	Gaussian Process surrogate model
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

	Optional	export_approx_points_file	Output file for surrogate model value evaluations
--	-----------------	---	---

Description

A surrogate-based optimization method will be used. The surrogate employed in `sbo` is a Gaussian process surrogate.

The main difference between `ego` and the `sbo` approach is the objective function being optimized. `ego` relies on an expected improvement function, while in `sbo`, the optimization proceeds using an evolutionary algorithm ([coliny_ea](#)) on the Gaussian process surrogate: it is a standard surrogate-based optimization. Also note that the `sbo` option can support optimization over discrete variables (the discrete variables are relaxed) while `ego` cannot.

This is not the same as [surrogate_based_global](#).

7.2.66.3.1 gaussian_process

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [gaussian_process](#)

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group GP Implementation (Group 1)	Dakota Keyword	Dakota Keyword Description
			surfpack	Use the Surfpack version of Gaussian Process surrogates
			dakota	Select the built in Gaussian Process surrogate
			experimental	Use the experimental Gaussian Process surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.66.3.1.1 surfpack

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [gaussian_process](#)
- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

7.2.66.3.1.2 dakota

- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [gaussian_process](#)
- [dakota](#)

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the Surfpack GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

7.2.66.3.1.3 experimental

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [gaussian_process](#)
- [experimental](#)

Use the experimental Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		options_file	Filename for a YAML file that specifies Gaussian process options

Description

The experimental GP surrogate is an emerging capability intended to supersede the `dakota` and `surfpack` GP implementations by unifying the best features of both. It also includes additional features such as the ability to export the model and then use it from Python.

See Also

These keywords may also be of interest:

- [options_file](#)

Filename for a YAML file that specifies Gaussian process options

Specification

Alias: none

Argument(s): STRING

Default: no advanced options file

Description

The YAML file contains configuration options that are used to populate a Teuchos ParameterList used by the Gaussian process that will override other keyword-specified parameters. Missing options in the YAML file are set to default values.

Examples

```
# FILE: gp_options.yaml

GP Parameters:
  Sigma Bounds:
    lower bound: 1.0e-2
    upper bound: 1.0e2
  scaler name: standardization
  num restarts: 20
  Nugget:
    fixed nugget: 0.0
    estimate nugget: true
  Bounds:
    lower bound: 3.17e-8
    upper bound: 1.0e-2
  gp seed: 42
  standardize response: false
  Trend:
    estimate trend: true
  Options:
    max degree: 2
    reduced basis: false
    p-norm: 1.0
    scaler type: none
```

```

    regression solver type: SVD
    verbosity: 1
kernel type: squared exponential
Length-scale Bounds:
    lower bound: 1.0e-2
    upper bound: 1.0e2
verbosity: 1

```

7.2.66.3.2 use_derivatives

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.66.3.3 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.66.3.3.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1             0.9          1.1          0.0002          0.26          0.76
2             0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3             0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.3.3.5 annotated

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID           0.9          1.1          0.0002          0.26          0.76
2          NO_ID           0.90009       1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID           0.89991       1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.3.3.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.3.3.7 active_only

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.66.3.4 export_approx_points_file

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)

- [sbgo](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: export_points_file

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.66.3.4.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [sbgo](#)
- [export_approx_points_file](#)

7.2.66.4 ego

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)

Use the Efficient Global Optimization method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		gaussian_process	Gaussian Process surrogate model
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations

Description

In the case of `ego`, the efficient global optimization (EGO) method is used to calculate bounds. By default, the Surfpack GP (Kriging) model is used, but the Dakota implementation may be selected instead. If `use_derivatives` is specified the GP model will be built using available derivative data (Surfpack GP only).

See [efficient_global](#) for more information.

7.2.66.4.1 gaussian_process

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [gaussian_process](#)

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional	Description of Group GP Implementation (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		surfpack	Use the Surfpack version of Gaussian Process surrogates
			dakota	Select the built in Gaussian Process surrogate
			experimental	Use the experimental Gaussian Process surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.66.4.1.1 surfpack

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [gaussian_process](#)
- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		export_model	export_model not active

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the Surfpack GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.66.4.3 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format

		annotated	Selects annotated tabular file format
		freeform	Selects freeform file format
	Optional	active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.66.4.3.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

%eval_id	x1	x2	obj_fn	nln_ineq_con_1	nln_ineq_con_2
1	0.9	1.1	0.0002	0.26	0.76
2	0.90009	1.1	0.0001996404857	0.2601620081	0.759955

7.2.66.4.3.5 `annotated`

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002      0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.4.3.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009      1.1 0.0001996404857  0.2601620081  0.759955
0.89991      1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.66.4.3.7 active_only

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.66.4.4 `export_approx_points_file`

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

			freeform	Selects freeform file format
--	--	--	--------------------------	------------------------------

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.66.4.4.1 `custom_annotated`

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.4.4.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ego](#)
- [export_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.66.5 ea

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [ea](#)

Use an evolutionary algorithm

Specification

Alias: none

Argument(s): none

Description

In this approach, the evolutionary algorithm from Coliny, [coliny_ea](#), is used to perform the interval optimization with no surrogate model involved. Again, this option of `ea` can support interval optimization over discrete variables.

7.2.66.6 lhs

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.66.7 response_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [response_levels](#)

Values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF probabilities/reliabilities to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		<code>num_response_levels</code>	Number of values at which to estimate desired statistics for each response
	Optional		<code>compute</code>	Selection of statistics to compute at each response level

Description

The `response_levels` specification provides the target response values for which to compute probabilities, reliabilities, or generalized reliabilities (forward mapping).

Default Behavior

If `response_levels` are not specified, no statistics will be computed. If they are, probabilities will be computed by default.

Expected Outputs

If `response_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Usage Tips

The `num_response_levels` is used to specify which arguments of the `response_level` correspond to which response.

Examples

For example, specifying a `response_level` of 52.3 followed with `compute probabilities` will result in the calculation of the probability that the response value is less than or equal to 52.3, given the uncertain distributions on the inputs.

For an example with multiple responses, the following specification

```
response_levels = 1. 2. .1 .2 .3 .4 10. 20. 30.
num_response_levels = 2 4 3
```

would assign the first two response levels (1., 2.) to response function 1, the next four response levels (.1, .2, .3, .4) to response function 2, and the final three response levels (10., 20., 30.) to response function 3. If the `num-`

`_response_levels` key were omitted from this example, then the response levels would be evenly distributed among the response functions (three levels each in this case).

The Dakota input file below specifies a sampling method with response levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors     = 'TF1n' 'TF2n'
  uniform_uncertain = 2
  lower_bounds    = 199.3, 474.63
  upper_bounds    = 298.5, 712.
  descriptors     = 'TF1u' 'TF2u'
  weibull_uncertain = 2
  alphas          = 12., 30.
  betas           = 250., 590.
  descriptors     = 'TF1w' 'TF2w'
  histogram_bin_uncertain = 2
  num_pairs      = 3 4
  abscissas     = 5 8 10 .1 .2 .3 .4
  counts        = 17 21 0 12 24 12 0
  descriptors   = 'TF1h' 'TF2h'
  histogram_point_uncertain
  real = 1
  num_pairs    = 2
  abscissas   = 3 4
  counts      = 1 1
  descriptors = 'TF3h'

interface,
  system_async_evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses,
  response_functions = 3
  no_gradients
  no_hessians
```

Given the above Dakota input file, the following excerpt from the output shows the PDF and CCDF generated. Note that the bounds on the bins of the PDF are the response values specified in the input file. The probability levels corresponding to those response values are shown in the CCDF.

Probability Density Function (PDF) histograms for each response function:

PDF for response_fn_1:

  4.5000000000e+05  0.0000000000e+00
```

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

A forward mapping involves computing the belief and plausibility probability level for a specified response level.

7.2.66.7.1 num_response_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [response_levels](#)
- [num_response_levels](#)

Number of values at which to estimate desired statistics for each response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: response_levels evenly distributed among response functions

Description

The `num_response_levels` keyword allows the user to specify the number of response values, for each response, at which estimated statistics are of interest. Statistics that can be computed are probabilities and reliabilities, both according to either a cumulative distribution function or a complementary cumulative distribution function.

Default Behavior

If `num_response_levels` is not specified, the `response_levels` will be evenly distributed among the responses.

Expected Outputs

The specific output will be determined by the type of statistics that are specified. In a general sense, the output will be a list of response level-statistic pairs that show the estimated value of the desired statistic for each response level specified.

Examples

```
method
  sampling
    samples = 100
    seed = 34785
    num_response_levels = 1 1 1
    response_levels = 0.5 0.5 0.5
```

7.2.66.7.2 compute

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [response_levels](#)
- [compute](#)

Selection of statistics to compute at each response level

Specification

Alias: none

Argument(s): none

Default: probabilities

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Statistics to Compute (Group 1)	Dakota Keyword probabilities	Dakota Keyword Description Computes probabilities associated with response levels
			gen_reliabilities	Computes generalized reliabilities associated with response levels

	Optional	system	Compute system reliability (series or parallel)
--	-----------------	------------------------	---

Description

The `compute` keyword is used to select which forward stastical mapping is calculated at each response level.

Default Behavior

If `response_levels` is not specified, no statistics are computed. If `response_levels` is specified but `compute` is not, probabilities will be computed by default. If both `response_levels` and `compute` are specified, then on of the following must be specified: `probabilities`, `reliabilities`, or `gen_reliabilities`.

Expected Output

The type of statistics specified by `compute` will be reported for each response level.

Usage Tips

CDF/CCDF probabilities are calculated for specified response levels using a simple binning approach.

CDF/CCDF reliabilities are calculated for specified response levels by computing the number of sample standard deviations separating the sample mean from the response level.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute reliabilities
```

7.2.66.7.2.1 probabilities

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [response_levels](#)
- [compute](#)
- [probabilities](#)

Computes probabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `probabilities` keyword directs Dakota to compute the probability that the model response will be below (cumulative) or above (complementary cumulative) a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the probabilities are computed by default. To explicitly specify it in the Dakota input file, though, the `probabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-probability pairs that give the probability that the model response will be below or above the corresponding response level, depending on the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
    complementary distribution
    response_levels = 3.6e+11 4.0e+11 4.4e+11
                    6.0e+04 6.5e+04 7.0e+04
                    3.5e+05 4.0e+05 4.5e+05
    compute probabilities
```

7.2.66.7.2.2 `gen_reliabilities`

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [response_levels](#)
- [compute](#)
- [gen_reliabilities](#)

Computes generalized reliabilities associated with response levels

Specification

Alias: none

Argument(s): none

Description

The `gen_reliabilities` keyword directs Dakota to compute generalized reliabilities according to the specified distribution for a specified response value. This is done for every response level designated for each response.

Default Behavior

If `response_levels` is specified, the generalized reliabilities are not computed by default. To change this behavior, the `gen_reliabilities` keyword should be specified in conjunction with the `compute` keyword.

Expected Outputs

The Dakota output is a set of response level-generalized reliability pairs according to the distribution defined.

Examples

```
method
  sampling
    sample_type random
    samples = 100 seed = 1
  complementary distribution
  response_levels = 3.6e+11 4.0e+11 4.4e+11
                   6.0e+04 6.5e+04 7.0e+04
                   3.5e+05 4.0e+05 4.5e+05
  compute gen_reliabilities
```

7.2.66.8 probability_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [probability_levels](#)

Specify probability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_probability_levels	Specify which probability_levels correspond to which response

Description

Response levels are calculated for specified CDF/CCDF probabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Expected Output

If `probability_levels` are specified, Dakota will create two tables in the standard output: a Probability Density function (PDF) histogram and a Cumulative Distribution Function (CDF) table. The PDF histogram has the lower and upper endpoints of each bin and the corresponding density of that bin. Note that the PDF histogram has bins defined by the `probability_levels` and/or `response_levels` in the Dakota input file. If there are not very many levels, the histogram will be coarse. Dakota does not do anything to optimize the bin size or spacing. The CDF table has the list of response levels and the corresponding probability that the response value is less than or equal to each response level threshold.

Examples

The Dakota input file below specifies a sampling method with probability levels of interest.

```
method,
  sampling,
  samples = 100 seed = 1
  complementary distribution
  probability_levels = 1. .66 .33 0.
                    1. .8 .5 0.
                    1. .3 .2 0.

variables,
  normal_uncertain = 2
  means            = 248.89, 593.33
  std_deviations  = 12.4, 29.7
  descriptors      = 'TF1n' 'TF2n'
```

```

uniform_uncertain = 2

5.6511827775e+04	8.0000000000e-01		
6.1603813790e+04	5.0000000000e-01		
7.8702465755e+04	0.0000000000e+00		

Complementary Cumulative Distribution Function (CCDF) for response_fn_3:

Response Level	Probability Level	Reliability Index	General Rel Index
2.3796737090e+05	1.0000000000e+00		

3.6997214153e+05	3.0000000000e-01
3.8100966235e+05	2.0000000000e-01
4.4111498127e+05	0.0000000000e+00

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.66.8.1 num_probability_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [probability_levels](#)
- [num_probability_levels](#)

Specify which `probability_levels` correspond to which response

Specification

Alias: none

Argument(s): INTEGERLIST

Default: `probability_levels` evenly distributed among response functions

Description

See parent page

7.2.66.9 gen_reliability_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [gen_reliability_levels](#)

Specify generalized reliability levels at which to estimate the corresponding response value

Specification

Alias: none

Argument(s): REALLIST

Default: No CDF/CCDF response levels to compute

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		num_gen_reliability_levels	Specify which gen_reliability_levels correspond to which response

Description

Response levels are calculated for specified generalized reliabilities by indexing into a sorted samples array (the response levels computed are not interpolated and will correspond to one of the sampled values).

Theory

Sets of response-probability pairs computed with the forward/inverse mappings define either a cumulative distribution function (CDF) or a complementary cumulative distribution function (CCDF) for each response function.

In the case of evidence-based epistemic methods, this is generalized to define either cumulative belief and plausibility functions (CBF and CPF) or complementary cumulative belief and plausibility functions (CCBF and CCPF) for each response function.

An inverse mapping involves computing the belief and plausibility response level for either a specified probability level or a specified generalized reliability level (two results for each level mapping in the evidence-based epistemic case, instead of the one result for each level mapping in the aleatory case).

7.2.66.9.1 num_gen_reliability_levels

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [gen_reliability_levels](#)
- [num_gen_reliability_levels](#)

Specify which `gen_reliability_levels` correspond to which response

Specification

Argument(s): INTEGERLIST

Default: `gen_reliability_levels` evenly distributed among response functions

Description

See parent page

7.2.66.10 distribution

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [distribution](#)

Selection of cumulative or complementary cumulative functions

Specification

Alias: none

Argument(s): none

Default: cumulative (CDF)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Distribution Type (CDF/CCDF) (Group 1)	Dakota Keyword cumulative	Dakota Keyword Description Computes statistics according to cumulative functions
			complementary	Computes statistics according to complementary cumulative functions

Description

The `distribution` keyword allows the user to select between a cumulative distribution/belief/plausibility function and a complementary cumulative distribution/belief/plausibility function. This choice affects how probabilities and reliability indices are reported.

Default Behavior

If the `distribution` keyword is present, it must be accompanied by either `cumulative` or `complementary`. Otherwise, a cumulative distribution will be used by default.

Expected Outputs

Output will be a set of model response-probability pairs determined according to the choice of distribution. The choice of distribution also defines the sign of the reliability or generalized reliability indices.

Examples

```
method
  sampling
```

```
sample_type lhs
samples = 10
distribution cumulative
```

7.2.66.10.1 cumulative

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [distribution](#)
- [cumulative](#)

Computes statistics according to cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a cumulative distribution/belief/plausibility function.

Default Behavior

By default, a cumulative distribution/belief/plausibility function will be used. To explicitly specify it in the Dakota input file, however, the `cumulative` keyword must be appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls below given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution cumulative
```

7.2.66.10.2 complementary

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [distribution](#)
- [complementary](#)

Computes statistics according to complementary cumulative functions

Specification

Alias: none

Argument(s): none

Description

Statistics on model responses will be computed according to a complementary cumulative distribution/belief/plausibility function.

Default Behavior

By default, a complementary cumulative distribution/belief/plausibility function will not be used. To change that behavior, the `complementary` keyword must appear in conjunction with the `distribution` keyword.

Expected Outputs

Output will be a set of model response-probability pairs determined according to a complementary cumulative distribution/belief/plausibility function. The probabilities reported are the probabilities that the model response falls above given response thresholds.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    distribution complementary
```

7.2.66.11 rng

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister

			<code>rnum2</code>	Generates pseudo-random numbers using the Pecos package
--	--	--	--------------------	---

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.66.11.1 mt19937

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.66.11.2 rnum2

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.66.12 model_pointer

- [Keywords Area](#)
- [method](#)
- [global_evidence](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which [model](#) block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a [model](#) block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6

  sample_type lhs
  distribution cumulative

model
  id_model = 'SURR'

  sampling sample_type lhs
  samples = 121 seed = 5034 rng rnum2

model
  id_model = 'DACE_M'
  single
  interface_pointer = 'I1'
```

```
variables
  uniform_uncertain = 2
  lower_bounds = 0. 0.
  upper_bounds = 1. 1.
  descriptors = 'x1' 'x2'

interface
  id_interface = 'I1'
  system asynch evaluation_concurrency = 5
  analysis_driver = 'text_book'

responses
  response_functions = 3
  no_gradients
  no_hessians
```

7.2.67 `global_interval_est`

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)

Interval analysis using global optimization methods

Topics

This keyword is related to the topics:

- [uncertainty_quantification](#)
- [epistemic_uncertainty_quantification_methods](#)
- [interval_estimation](#)

Specification

Alias: `nond_global_interval_est`

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		samples	Number of samples for sampling-based methods
	Optional		seed	Seed of the random number generator
	Optional		max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional		convergence_tolerance	Stopping criterion based on objective function or statistics convergence
	Optional		max_function_evaluations	Number of function evaluations allowed for optimizers
	Optional (<i>Choose One</i>)	Solution Approach (Group 1)	sbgo	Use the surrogate based optimization method
			ego	Use the Efficient Global Optimization method
			ea	Use an evolutionary algorithm
			lhs	Uses Latin Hypercube Sampling (LHS) to sample variables
	Optional		rng	Selection of a random number generator
	Optional		model_pointer	Identifier for model block to be used by a method

Description

In the global approach to interval estimation, one uses either a global optimization method or a sampling method to assess the bounds of the responses.

`global_interval_est` allows the user to specify several approaches to calculate interval bounds on the output responses.

- `lhs` - note: this takes the minimum and maximum of the samples as the bounds
- `ego`

- [sbo](#)
- [ea](#)

Additional Resources

Refer to [variable_support](#) for information on supported variable types.

See Also

These keywords may also be of interest:

- [global_evidence](#)
- [local_evidence](#)
- [local_interval_est](#)

7.2.67.1 `samples`

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [samples](#)

Number of samples for sampling-based methods

Specification

Alias: none

Argument(s): INTEGER

Description

The `samples` keyword is used to define the number of samples (i.e., randomly chosen sets of variable values) at which to execute a model.

Default Behavior

By default, Dakota will use the minimum number of samples required by the chosen method.

Usage Tips

To obtain linear sensitivities or to construct a linear response surface, at least $\text{dim}+1$ samples should be used, where "dim" is the number of variables. For sensitivities to quadratic terms or quadratic response surfaces, at least $(\text{dim}+1)(\text{dim}+2)/2$ samples are needed. For uncertainty quantification, we recommend at least $10*\text{dim}$ samples. For `variance_based_decomp`, we recommend hundreds to thousands of samples. Note that for `variance_based_decomp`, the number of simulations performed will be $N*(\text{dim}+2)$.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.67.2 seed

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.67.3 max_iterations

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [max_iterations](#)

Number of iterations allowed for optimizers and adaptive UQ methods

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 100 (exceptions: fsu_cvt , local_reliability: 25; global_{reliability , interval_est , evidence} / efficient_global: 25*n)

Description

The maximum number of iterations is used as a stopping criterion for optimizers and some adaptive UQ methods. If it has not reached any other stopping criteria first, the method will stop after it has performed `max_iterations` iterations. In cases where there are multiple nested iterations to be controlled, `max_iterations` generally controls the outer-most context.

Default Behavior

Default value is 100.

See Also

These keywords may also be of interest:

- [max_function_evaluations](#)

7.2.67.4 convergence_tolerance

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [convergence_tolerance](#)

Stopping criterion based on objective function or statistics convergence

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): REAL

Default: 1.e-4

Description

The `convergence_tolerance` specification provides a real value for controlling the termination of iteration.

For optimization, it is most commonly a **relative convergence tolerance** for the objective function; i.e., if the change in the objective function between successive iterations divided by the previous objective function is less than the amount specified by `convergence_tolerance`, then this convergence criterion is satisfied on the current iteration.

Therefore, permissible values are between 0 and 1, non-inclusive.

Behavior Varies by Package/Library

This control is used with most optimization and least squares iterators (DOT, CONMIN, NLPQLP, NPSOL, NLSSOL, OPT++, and SCOLIB). Most other Dakota methods (such as DACE or parameter studies) do not use this control, but some adaptive methods, such as adaptive UQ, do.

Since no progress may be made on one iteration followed by significant progress on a subsequent iteration, some libraries require that the convergence tolerance be satisfied on two or more consecutive iterations prior to termination of iteration.

Notes on each library:

- DOT: relative tolerance that must be satisfied for two consecutive iterations
- NL2SOL: See [nl2sol](#)
- NLPQLP: used as Lagrangian gradient norm tolerance (ACC), not as a relative convergence tolerance
- NPSOL: used as a line search tolerance, not as a relative convergence tolerance

7.2.67.5 `max_function_evaluations`

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [max_function_evaluations](#)

Number of function evaluations allowed for optimizers

Topics

This keyword is related to the topics:

- [method_independent_controls](#)

Specification

Alias: none

Argument(s): INTEGER

Default: 1000

Description

The maximum number of function evaluations is used as a stopping criterion for optimizers. If it has not reached any other stopping criteria first, the optimizer will stop after it has performed `max_function_evaluations` evaluations. See also `max_iterations`.

Some optimizers (e.g. `ncsu_direct`) may run past this limit in the course of an iteration step that began before `max_function_evaluations` was exceeded.

Default Behavior

Default value is 1000.

7.2.67.6 sbgo

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)

Use the surrogate based optimization method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		gaussian_process	Gaussian Process surrogate model
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations

Description

A surrogate-based optimization method will be used. The surrogate employed in `sbo` is a Gaussian process surrogate.

The main difference between `ego` and the `sbo` approach is the objective function being optimized. `ego` relies on an expected improvement function, while in `sbo`, the optimization proceeds using an evolutionary algorithm ([coliny_ea](#)) on the Gaussian process surrogate: it is a standard surrogate-based optimization. Also note that the `sbo` option can support optimization over discrete variables (the discrete variables are relaxed) while `ego` cannot.

This is not the same as [surrogate_based_global](#).

7.2.67.6.1 gaussian_process

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [gaussian_process](#)

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	GP Implementation (Group 1)	surfpack	Use the Surfpack version of Gaussian Process surrogates
			dakota	Select the built in Gaussian Process surrogate
			experimental	Use the experimental Gaussian Process surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.67.6.1.1 surfpack

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [gaussian_process](#)

- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use

derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

7.2.67.6.1.2 dakota

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [gaussian_process](#)
- [dakota](#)

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the `dakota` version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the Surfpack GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

7.2.67.6.1.3 experimental

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [gaussian_process](#)
- [experimental](#)

Use the experimental Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		options_file	Filename for a YAML file that specifies Gaussian process options

Description

The experimental GP surrogate is an emerging capability intended to supersede the `dakota` and `surfpack` GP implementations by unifying the best features of both. It also includes additional features such as the ability to export the model and then use it from Python.

- [sbgo](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surpack Gaussian process).

However, its use with Surpack Gaussian process is not recommended.

7.2.67.6.3 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.67.6.3.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76

- [sbgo](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.6.3.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009      1.1 0.0001996404857  0.2601620081  0.759955

...

```

7.2.67.6.3.7 active_only

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.67.6.4 export_approx_points_file

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [sbgo](#)
- [export_approx_points_file](#)

Output file for surrogate model value evaluations

Specification

Alias: `export_points_file`

Argument(s): STRING

Default: no point export to a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format

			freeform	Selects freeform file format
--	--	--	--------------------------	------------------------------

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.67.6.4.1 `custom_annotated`

- [Keywords Area](#)

7.2.67.7 ego

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)

Use the Efficient Global Optimization method

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		gaussian_process	Gaussian Process surrogate model
	Optional		use_derivatives	Use derivative data to construct surrogate models
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		export_approx_points_file	Output file for surrogate model value evaluations

Description

In the case of `ego`, the efficient global optimization (EGO) method is used to calculate bounds. By default, the Surfpack GP (Kriging) model is used, but the Dakota implementation may be selected instead. If `use_derivatives` is specified the GP model will be built using available derivative data (Surfpack GP only).

See [efficient_global](#) for more information.

7.2.67.7.1 `gaussian_process`

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [gaussian_process](#)

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	GP Implementation (Group 1)	surfpack	Use the Surfpack version of Gaussian Process surrogates

			dakota	Select the built in Gaussian Process surrogate
			experimental	Use the experimental Gaussian Process surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the `dakota` version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.67.7.1.1 surfpack

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [gaussian_process](#)
- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		export_model	Exports surrogate model in user-specified format(s)

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

	Required		formats	Formats for surrogate model export

Description

Export the surrogate for later re-import to Dakota or evaluation using the `surfpack` executable (`bin/surfpack`) or a user-developed tool. Export format is controlled using the `formats` specification. Four formats are available in Dakota; however, not all have been enabled for all surrogates.

The four formats are:

- `text_archive` - Plain-text, machine-readable archive for re-import or use with the `surfpack` executable
- `binary_archive` - Binary, machine-readable archive for re-import or use with the `surfpack` executable
- `algebraic_file` - Plain-text, human-readable file intended for use with user-created tools; not compatible with Dakota or the `surfpack` executable
- `algebraic_console` - Print the model in algebraic format to the screen; not compatible with Dakota or the `surfpack` executable

These global surrogates can be exported in all four formats:

- Gaussian process (keyword `gaussian_process` `surfpack`)

- Artificial neural network (keyword `neural_network`)
- Radial basis Functions (keyword `radial_basis`)
- Polynomial (keyword `polynomial`)

However, for experimental Gaussian Process and polynomial models as well as Multivariate Adaptive Regression Spline (keyword `mars`) and moving least squares (keyword `moving_least_squares`) models, only `text_archive` and `binary_archive` formats may be used.

Currently, no other surrogate models can be exported.

Default Behavior

No export.

Expected Output

Output depends on selected format; see the `formats` specification.

Additional Discussion

The Dakota examples include a demonstration of using the `surfpack` executable with an exported model file.

7.2.67.7.1.3 filename_prefix

- [ego](#)
- [gaussian_process](#)
- [surfpack](#)
- [export_model](#)
- [filename_prefix](#)

User-customizable portion of exported/imported surrogate model filenames

Topics

This keyword is related to the topics:

- [surrogate_models](#)

Specification

Alias: none

Argument(s): STRING

Default: `exported_surrogate`

Description

Dakota surrogate model files are exported and imported using one file per response, per requested format. The files are named using the pattern `{prefix}.{response_descriptor}.{extension}`. This `filename_prefix` keyword is used to supply the prefix portion of the pattern.

The `response_descriptor` portion of the pattern is filled in using the response [descriptors](#) provided by the user (or, if none are specified, descriptors automatically generated by Dakota). Extension is a three or four letter string that depends on the format.

Examples

This input snippet directs Dakota to write one algebraic format file and one binary archive file for each response. The names of the files will follow the patterns `my_surrogate.{response_descriptor}.alg` (for the algebraic files) and `my_surrogate.{response_descriptor}.bsps` (for the binary files).

```
surrogate global gaussian_process surfpack
  export_model
    filename_prefix = 'my_surrogate'
    formats
      algebraic_file
      binary_archive
```

Surrogate model plain-text archive file format

Topics

This keyword is related to the topics:

- [surrogate_models](#)

Specification

Alias: none

Argument(s): none

Description

When specified, the surrogate model will be exported (or imported) using a plain-text archive format.

Experimental surrogates will export to (import from) text archives named `{prefix}.{response_descriptor}.txt`.

Other (Surfpack) surrogates will export/import using files named `{prefix}.{response_descriptor}.sps`, in which 'sps' stands for Surfpack surrogate.

See `filename_prefix` for further information about surrogate file naming.

Examples

The Dakota examples include a demonstration of using the surfpack executable with an exported model file.

Surrogate model binary archive file format

Topics

This keyword is related to the topics:

- [surrogate_models](#)

Specification

Alias: none

Argument(s): none

Description

When specified, the surrogate model will be exported (or imported) using a binary archive format.

Experimental surrogates will export to (import from) binary archives named `{prefix}.{response_descriptor}.bin`.

Other (Surfpack) surrogates will export/import using files named `{prefix}.{response_descriptor}.bsps`, in which 'bsps' stands for binary Surfpack surrogate.

See `filename_prefix` for further information about surrogate file naming.

Examples

The Dakota examples include a demonstration of using the surfpack executable with an exported model file.

7.2.67.7.1.7 dakota

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [gaussian_process](#)
- [dakota](#)

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the `Surfpack` GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

7.2.67.7.1.8 experimental

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [gaussian_process](#)
- [experimental](#)

Use the experimental Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		export_model	Exports surrogate model in user-specified format(s)
	Optional		options_file	Filename for a YAML file that specifies Gaussian process options

Description

The experimental GP surrogate is an emerging capability intended to supersede the `dakota` and `surfpack` GP implementations by unifying the best features of both. It also includes additional features such as the ability to export the model and then use it from Python.

Exports surrogate model in user-specified format(s)

Topics

This keyword is related to the topics:

- [surrogate_models](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		filename_prefix	User-customizable portion of exported/imported surrogate model filenames
	Required		formats	Formats for surrogate model export

Description

Export the surrogate for later re-import to Dakota or evaluation using the `surfpack` executable (`bin/surfpack`) or a user-developed tool. Export format is controlled using the `formats` specification. Four formats are available in Dakota; however, not all have been enabled for all surrogates.

The four formats are:

- `text_archive` - Plain-text, machine-readable archive for re-import or use with the `surfpack` executable
- `binary_archive` - Binary, machine-readable archive for re-import or use with the `surfpack` executable
- `algebraic_file` - Plain-text, human-readable file intended for use with user-created tools; not compatible with Dakota or the `surfpack` executable
- `algebraic_console` - Print the model in algebraic format to the screen; not compatible with Dakota or the `surfpack` executable

These global surrogates can be exported in all four formats:

- Gaussian process (keyword `gaussian_process` `surfpack`)
- Artificial neural network (keyword `neural_network`)
- Radial basis Functions (keyword `radial_basis`)
- Polynomial (keyword `polynomial`)

However, for experimental Gaussian Process and polynomial models as well as Multivariate Adaptive Regression Spline (keyword `mars`) and moving least squares (keyword `moving_least_squares`) models, only `text_archive` and `binary_archive` formats may be used.

Currently, no other surrogate models can be exported.

Default Behavior

No export.

Expected Output

Output depends on selected format; see the `formats` specification.

Additional Discussion

The Dakota examples include a demonstration of using the `surfpack` executable with an exported model file.

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [gaussian_process](#)
- [experimental](#)
- [options_file](#)

Filename for a YAML file that specifies Gaussian process options

Specification

Alias: none

Argument(s): STRING

Default: no advanced options file

Description

The YAML file contains configuration options that are used to populate a Teuchos ParameterList used by the Gaussian process that will override other keyword-specified parameters. Missing options in the YAML file are set to default values.

Examples

```
# FILE: gp_options.yaml

GP Parameters:
  Sigma Bounds:
    lower bound: 1.0e-2
    upper bound: 1.0e2
  scaler name: standardization
  num restarts: 20
  Nugget:
    fixed nugget: 0.0
    estimate nugget: true
  Bounds:
    lower bound: 3.17e-8
```

```
    upper bound: 1.0e-2
gp seed: 42
standardize response: false
Trend:
  estimate trend: true
Options:
  max degree: 2
  reduced basis: false
  p-norm: 1.0
  scaler type: none
  regression solver type: SVD
  verbosity: 1
kernel type: squared exponential
Length-scale Bounds:
  lower bound: 1.0e-2
  upper bound: 1.0e2
verbosity: 1
```

7.2.67.7.2 use_derivatives

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.67.7.3 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.67.7.3.1 custom_annotated

- [Keywords Area](#)
- [method](#)

- [global_interval_est](#)
- [ego](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.

- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.7.3.5 annotated

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [import_build_points_file](#)

- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.7.3.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.7.3.7 active_only

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.67.7.4 export_approx_points_file

- [Keywords Area](#)
- [method](#)

			freeform	Selects freeform file format

Description

Specifies a file in which the points (input variable values) at which the surrogate model is evaluated and corresponding response values computed by the surrogate model will be written. The response values are the surrogate's predicted approximation to the truth model responses at those points.

Usage Tips

Dakota exports tabular data in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

7.2.67.7.4.1 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [export_approx_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1      x2      obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9      1.1      0.0002      0.26      0.76
2             0.90009  1.1 0.0001996404857  0.2601620081  0.759955
3             0.89991  1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.67.7.4.5 annotated

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [export_approx_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009       1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991       1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.7.4.6 freeform

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ego](#)
- [export_approx_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.67.8 ea

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [ea](#)

Use an evolutionary algorithm

Specification

Alias: none

Argument(s): none

Description

In this approach, the evolutionary algorithm from Coliny, [coliny_ea](#), is used to perform the interval optimization with no surrogate model involved. Again, this option of `ea` can support interval optimization over discrete variables.

7.2.67.9 lhs

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [lhs](#)

Uses Latin Hypercube Sampling (LHS) to sample variables

Specification

Alias: none

Argument(s): none

Description

The `lhs` keyword invokes Latin Hypercube Sampling as the means of drawing samples of uncertain variables according to their probability distributions. This is a stratified, space-filling approach that selects variable values from a set of equi-probable bins.

Default Behavior

Latin Hypercube Sampling is the default sampling mode in most contexts (exception: `multilevel_sampling`). To explicitly specify LHS in the Dakota input file, the `lhs` keyword must appear in conjunction with the `sample_type` keyword.

Usage Tips

Latin Hypercube Sampling is very robust and can be applied to any problem. It is fairly effective at estimating the mean of model responses and linear correlations with a reasonably small number of samples relative to the number of variables.

Examples

```
method
  sampling
    sample_type lhs
    samples = 20
```

7.2.67.10 rng

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (`mt19937`)

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	RNG Algorithm (Group 1)	mt19937	Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.67.10.1 mt19937

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
```

```
samples = 10
seed = 98765
rng mt19937
```

7.2.67.10.2 rnum2

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.67.11 model_pointer

- [Keywords Area](#)
- [method](#)
- [global_interval_est](#)
- [model_pointer](#)

Identifier for model block to be used by a method

Topics

This keyword is related to the topics:

- [block_pointer](#)

Specification

Alias: none

Argument(s): STRING

Default: method use of last model parsed (or use of default model if none parsed)

Description

The `model_pointer` is used to specify which `model` block will be used to perform the function evaluations needed by the Dakota method.

Default Behavior

If not specified, a Dakota method will use the last model block parsed. If specified, there must be a `model` block in the Dakota input file that has a corresponding `id_model` with the same name.

Usage Tips

When doing advanced analyses that involve using multiple methods and multiple models, defining a `model_pointer` for each method is imperative.

See [block_pointer](#) for details about pointers.

Examples

```
environment
  tabular_data
  method_pointer = 'UQ'

method
  id_method = 'UQ'
  model_pointer = 'SURR'
  sampling,
    samples = 10
    seed = 98765 rng rnum2
    response_levels = 0.1 0.2 0.6
                    0.1 0.2 0.6
                    0.1 0.2 0.6
  sample_type lhs
  distribution cumulative

	Optional	model_discrepancy	(Experimental) Post-calibration calculation of model discrepancy correction

	Optional	sub_sampling_period	Specify a sub-sampling of the MCMC chain
	Optional	probability_levels	Specify probability levels at which to compute credible and prediction intervals
	Optional	convergence_tolerance	Stopping criterion based on objective function or statistics convergence
	Optional	max_iterations	Number of iterations allowed for optimizers and adaptive UQ methods
	Optional	model_pointer	Identifier for model block to be used by a method
	Optional	scaling	Turn on scaling for variables, responses, and constraints

Description

Bayesian calibration methods take prior information on parameter values (in the form of prior distributions) and observational data (e.g. from experiments) and infer posterior distributions on the parameter values. When the computational simulation is then executed with samples from the posterior parameter distributions, the results that are produced are consistent with ("agree with") the experimental data. Calibrating parameters from a computational simulation model requires a likelihood function that specifies the likelihood of observing a particular observation given the model and its associated parameterization; Dakota assumes a Gaussian likelihood function. The algorithms that produce the posterior distributions on model parameters are most commonly Monte Carlo Markov Chain (MCMC) sampling algorithms. MCMC methods require many samples, often tens of thousands, so in the case of model calibration, often emulators of the computational simulation are used. For more details on the algorithms underlying the methods, see the Dakota User's manual.

Dakota has four classes of Bayesian calibration methods: QUESO/DRAM, GPMSA, DREAM, and WASABI.

1. The QUESO methods use components from the QUESO library (Quantification of Uncertainty for Estimation, Simulation, and Optimization) developed at The University of Texas at Austin. Dakota uses its DRAM (Delayed Rejected Adaptive Metropolis) algorithm, and variants, for the MCMC sampling.
2. GPMSA (Gaussian Process Models for Simulation Analysis) is an approach developed at Los Alamos National Laboratory and Dakota currently uses the QUESO implementation. It constructs Gaussian process models to emulate the expensive computational simulation as well as model discrepancy. GPMSA also has extensive features for calibration, such as the capability to include a model discrepancy term and the capability to model functional data such as time series data. This is an experimental capability and not all features are available in Dakota yet.
3. DREAM (DiffeRential Evolution Adaptive Metropolis) is a method that runs multiple different chains simul-

taneously for global exploration, and automatically tunes the proposal covariance during the process by a self-adaptive randomized subspace sampling. [89].

4. WASABI: Non-MCMC Bayesian inference via interval analysis

Usage Tips

The Bayesian capabilities are under active development. At this stage, the QUESO methods in Dakota are the most advanced and robust, followed by DREAM, followed by GPMSA and WASABI which are not yet ready for production use.

The prior distribution is characterized by the properties of the uncertain variables. Correlated priors are only supported for unbounded normal, untruncated lognormal, uniform, exponential, gumbel, frechet, and weibull distributions and require specification of `standardized_space`, for example, for QUESO [standardized_space](#)

Note that as of Dakota 6.2, the field responses and associated field data may be used with QUESO and DREAM. That is, the user can specify field simulation data and field experiment data, and Dakota will interpolate and provide the proper residuals to the Bayesian calibration.

7.2.68.1 queso

- [Keywords Area](#)

Markov Chain Monte Carlo algorithms from the QUESO package

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)
- [package_queso](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		chain_samples	Number of Markov Chain Monte Carlo posterior samples

	Optional		seed	Seed of the random number generator
	Optional		rng	Selection of a random number generator
	Optional		emulator	Use an emulator or surrogate model to evaluate the likelihood function
	Optional		standardized_ - space	Perform Bayesian inference in standardized probability space
	Optional		logit_transform	Utilize the logit transformation to reduce sample rejection for bounded domains
	Optional		export_chain_ - points_file	Export the MCMC chain to the specified filename
	Optional		dram	Use the DRAM MCMC algorithm
	Optional (<i>Choose One</i>)	MCMC Algorithm (Group 1)	delayed_rejection	Use the Delayed Rejection MCMC algorithm
			adaptive_ - metropolis	Use the Adaptive Metropolis MCMC algorithm
			metropolis_ - hastings	Use the Metropolis-Hastings MCMC algorithm
			multilevel	Use the multilevel MCMC algorithm.
	Optional		pre_solve	Perform deterministic optimization for MAP before Bayesian calibration

	Optional	proposal_covariance	Defines the technique used to generate the MCMC proposal covariance.
	Optional	options_file	File containing advanced QUESO options

Description

The `queso` method supports the following MCMC algorithms: DRAM (Delayed Rejection Adaptive Metropolis), delayed rejection (DR) only, adaptive metropolis (AM) only, pure Metropolis Hasting (MH)s, and multilevel (ML).

When calibrating fast-running simulation models, use of an emulator is not typically warranted. For slower models, using an emulator model in the MCMC sampling will greatly improve the speed, since the Monte Carlo Markov Chain will generate thousands of samples on the emulator instead of the real simulation code. An emulator may be specified with the keyword `emulator`, followed by a `gaussian_process` emulator, a `pce` emulator (polynomial chaos expansion), or a `sc` emulator (stochastic collocation). For the `gaussian_process` emulator, the user must specify whether to use the `surfpack` or `dakota` version of the Gaussian process. The user can define the number of samples `build_samples` from which the emulator should be built. It is also possible to build the Gaussian process from points read in from the `import_points_file` and to export approximation-based sample evaluations using `export_points_file`. For `pce` or `sc`, the user can define a `sparse_grid_level`.

There are a variety of ways the user can specify the proposal covariance matrix which is very important in governing the samples generated in the chain. The proposal covariance specifies the covariance structure of a multivariate normal distribution. The user can specify `proposal_covariance`, followed by `derivatives`, `prior`, `values`, or `filename`. The derivative specification involves forming the Hessian of the misfit function (the negative log likelihood). When derivative information is available inexpensively (e.g. from an emulator), the derived-based proposal covariance forms a more accurate proposal distribution, resulting in lower rejection rates and faster chain mixing. The prior setting involves constructing the proposal from the variance of the prior distributions of the parameters being calibrated. When specifying the proposal covariance with values or from a file, the user can choose to specify only the diagonals of the covariance matrix with `diagonal` or to specify the full covariance matrix with `matrix`.

There are two other controls for QUESO. The `pre_solve` option enables the user to start the chain at an optimal point, the Maximum A Posteriori (MAP) point. This is the point in parameter space that maximizes the log posterior, (defined as the log-likelihood minus the log prior). A deterministic optimization method is used to obtain the MAP point, and the MCMC chain is then started at the best point found in the optimization. The second factor is a `logit_transform`, which performs an internal variable transformation from bounded domains to unbounded domains in order to reduce sample rejection due to an out-of-bounds condition.

Note that as of Dakota 6.2, the field data capability may be used with QUESO. That is, the user can specify field simulation data and field experiment data, and Dakota will interpolate and provide the proper residuals to the Bayesian calibration.

7.2.68.1.1 chain_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [chain_samples](#)

Number of Markov Chain Monte Carlo posterior samples

Specification

Alias: samples

Argument(s): INTEGER

Default: method-dependent

Description

The `chain_samples` keyword indicates the number of draws from the posterior distribution to perform. When an emulator is active, this will be the number of samples on the constructed surrogate model.

Default Behavior

The default number of chain samples is method-dependent. QUESO and MUQ methods use 1000. DREAM uses (number of generations) x (number of chains), resulting in `chain_samples` close to that specified.

Usage Tips

MCMC methods typically require a large number of chain samples to converge, often thousands to millions.

Examples

```
method
  bayes_calibration queso
  chain_samples = 20000
```

7.2.68.1.2 seed

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.68.1.3 rng

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (mt19937)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.68.1.4 emulator

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)

Use an emulator or surrogate model to evaluate the likelihood function

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Required (Choose One)	Emulator Type (Group 1)	gaussian_process	Gaussian Process surrogate model
			pce	Polynomial Chaos Expansion surrogate model
			ml_pce	Multilevel Polynomial Chaos Expansion as an emulator model.
			mf_pce	Multifidelity Polynomial Chaos Expansion as an emulator model.
			sc	Stochastic Collocation as an emulator model.
			mf_sc	Multifidelity Stochastic Collocation as an emulator model.

Description

This keyword describes the type of emulator used when calculating the likelihood function for the Bayesian calibration. The emulator can be a Gaussian process, polynomial chaos expansion, or stochastic collocation.

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	GP Implementation (Group 1)	surfpack	Use the Surfpack version of Gaussian Process surrogates
			dakota	Select the built in Gaussian Process surrogate
	Optional		build_samples	Number of initial model evaluations used in build phase
	Optional		posterior_adaptive	Adapt emulator model to increase accuracy in high posterior probability regions
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.68.1.4.2 surfpack

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [dakota](#)

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the Surfpack GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

7.2.68.1.4.4 build_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: none

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.68.1.4.5 posterior_adaptive

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```

bayes_calibration queso
  chain_samples = 2000 seed = 348
  delayed_rejection
  emulator
    gaussian_process surfpack build_samples = 30
    posterior_adaptive max_iterations = 10
    proposal_covariance derivatives

```

7.2.68.1.4.6 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.1.4.7 custom_annotated

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional	header	Enable header row in custom-annotated tabular file
	Optional	eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional	interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1         0.0002  0.26            0.76

- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76
2          NO_ID            0.90009      1.1 0.0001996404857 0.2601620081 0.759955

```

7.2.68.1.4.12 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)

- [gaussian_process](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.1.4.13 `active_only`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_ adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either uniform or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

7.2.68.1.4.16 uniform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [p_refinement](#)
- [uniform](#)

Refine an expansion uniformly in all dimensions.

Specification

Alias: none

Argument(s): none

Description

The quadrature_order or sparse_grid_level are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the uniform refinement case with regression approaches, the expansion_order is ramped by one on each iteration while the oversampling ratio (either defined by collocation_ratio or inferred from collocation_points based on the initial expansion) is held fixed.

Estimate spectral coefficient decay rates to guide dimension-adaptive refinement.

Specification

Alias: none

Argument(s): none

Description

Estimate spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation. These decay rates are used to guide dimension-adaptive refinement, where slower decay rates result in higher dimension preference.

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement decay
  max_iterations = 20
  convergence_tol = 1.e-4
```

Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Specification

Alias: none

Argument(s): none

Description

The generalized sparse grid algorithm is a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

Examples

```
method,
  polynomial_chaos
  sparse_grid_level = 3
  dimension_adaptive p_refinement generalized
  max_iterations = 20
  convergence_tol = 1.e-4
```

Order for tensor-products of Gaussian quadrature rules

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		dimension_ - preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order`, and, optionally, `dimension_preference`). The default rule selection is to employ `non_nested` Gauss rules including Gauss-Hermite (for normals or transformed normals), Gauss-Legendre (for uniforms or transformed uniforms), Gauss-Jacobi (for betas), Gauss-Laguerre (for exponentials), generalized Gauss-Laguerre (for gammas), and numerically-generated Gauss rules (for other distributions when using an Extended basis). For the case of `p_refinement` or the case of an explicit `nested` override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse. By specifying a `dimension_preference`, where higher preference leads to higher order polynomial resolution, the tensor grid may be rendered anisotropic. The dimension specified to have highest preference will be set to the specified `quadrature_order` and all other dimensions will be reduced in proportion to their reduced preference; any non-integral portion is truncated. To synchronize with tensor-product integration, a tensor-product expansion is used, where the order p_i of the expansion in each dimension is selected to be half of the integrand precision available from the rule in use, rounded down. In the case of non-nested Gauss rules with integrand precision $2m_i - 1$, p_i is one less than the quadrature order m_i in each dimension (a one-dimensional expansion contains the same number of terms, $p + 1$, as the number of Gauss points). The total number of terms, N , in a tensor-product expansion involving n uncertain input variables is

$$N = 1 + P = \prod_{i=1}^n (p_i + 1)$$

In some advanced use cases (e.g., multifidelity UQ), multiple grid resolutions can be employed; for this reason, the `quadrature_order` specification supports an array input.

A corresponding sequence specification is documented at, e.g., [quadrature_order_sequence](#) and [quadrature_order_sequence](#)

	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 2)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multi-dimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level` and, optionally, `dimension_preference`). The underlying one-dimensional integration rules are the same as for the tensor-product quadrature case; however, the default rule selection is nested for sparse grids (Genz-Keister for normals/transformed normals and Gauss-Patterson for uniforms/transformed uniforms). This default can be overridden with an explicit `non_nested` specification (resulting in Gauss-Hermite for normals/transformed normals and Gauss-Legendre for uniforms/transformed uniforms). As for tensor quadrature, the `dimension_preference` specification enables the use of anisotropic sparse grids (refer to the PCE description in the User's Manual for the anisotropic index set constraint definition). Similar to anisotropic tensor grids, the dimension with greatest preference will have resolution at the full `sparse_grid_level` and all other dimension resolutions will be reduced in proportion to their reduced preference. For PCE with either isotropic or anisotropic sparse grids, a summation of tensor-product expansions is used, where each anisotropic tensor-product quadrature rule underlying the sparse grid construction results in its own anisotropic tensor-product expansion as described in case 1. These anisotropic tensor-product expansions are summed into a sparse PCE using the standard Smolyak summation (again, refer to the User's Manual for additional details). As for `quadrature_order`, the `sparse_grid_level` specification admits an array input for enabling specification of multiple grid resolutions used by certain advanced solution methodologies.

A corresponding sequence specification is documented at, e.g., [sparse_grid_level_sequence](#) and [sparse_grid_level_sequence](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

Cubature using Stroud rules and their extensions

Specification

Alias: none

Argument(s): INTEGER

Description

Multi-dimensional integration by Stroud cubature rules [80] and extensions [94], as specified with `cubature_integrand`. A total-order expansion is used, where the isotropic order p of the expansion is half of the integrand order, rounded down. The total number of terms N for an isotropic total-order expansion of order p over n variables is given by

$$N = 1 + P = 1 + \sum_{s=1}^p \frac{1}{s!} \prod_{r=0}^{s-1} (n+r) = \frac{(n+p)!}{n!p!}$$

Since the maximum integrand order is currently five for normal and uniform and two for all other types, at most second- and first-order expansions, respectively, will be used. As a result, cubature is primarily useful for global sensitivity analysis, where the Sobol' indices will provide main effects and, at most, two-way interactions. In addition, the random variable set must be independent and identically distributed (*iid*), so the use of `askey` or `wiener` transformations may be required to create *iid* variable sets in the transformed space (as well as to allow usage of the higher order cubature rules for normal and uniform). Note that global sensitivity analysis often assumes uniform bounded regions, rather than precise probability distributions, so the *iid* restriction would not be problematic in that case.

The (initial) order of a polynomial expansion

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		dimension_preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional		basis_type	Specify the type of basis truncation to be used for a Polynomial Chaos Expansion.
	Required (<i>Choose One</i>)	Group 1	collocation_points	Number of collocation points used to estimate expansion coefficients
			collocation_ratio	Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.
			expansion_samples	Number of simulation samples used to estimate the expected value of a set of PCE coefficients
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		posterior_adaptive	Adapt emulator model to increase accuracy in high posterior probability regions

Description

When the `expansion_order` for a polynomial chaos expansion is specified, the coefficients may be computed by integration based on random samples or by regression using either random or sub-sampled tensor product

quadrature points.

Multidimensional integration by Latin hypercube sampling (specified with `expansion_samples`). In this case, the expansion order p cannot be inferred from the numerical integration specification and it is necessary to provide an `expansion_order` to specify p for a total-order expansion.

Linear regression (specified with either `collocation_points` or `collocation_ratio`). A total-order expansion is used and must be specified using `expansion_order` as described in the previous option. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$). When admissible, a constrained least squares approach is employed in which response values are first reproduced exactly and error in reproducing response derivatives is minimized. Two collocation grid options are supported: the default is Latin hypercube sampling ("point collocation"), and an alternate approach of "probabilistic collocation" is also available through inclusion of the `tensor_grid` keyword. In this alternate case, the collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

If `collocation_points` or `collocation_ratio` is specified, the PCE coefficients will be determined by regression. If no regression specification is provided, appropriate defaults are defined. Specifically SVD-based least-squares will be used for solving over-determined systems and under-determined systems will be solved using LASSO. For the situation when the number of function values is smaller than the number of terms in a PCE, but the total number of samples including gradient values is greater than the number of terms, the resulting over-determined system will be solved using equality constrained least squares. Technical information on the various methods listed below can be found in the Linear regression section of the Theory Manual. Some of the regression methods (OMP, LASSO, and LARS) are able to produce a set of possible PCE coefficient vectors (see the Linear regression section in the Theory Manual). If cross validation is inactive, then only one solution, consistent with the `noise_tolerance`, will be returned. If cross validation is active, Dakota will choose between possible coefficient vectors found internally by the regression method across the set of expansion orders ($1, \dots, \text{expansion_order}$) and the set of specified noise tolerances and return the one with the lowest cross validation error indicator.

Argument(s): none

Description

Calculate the coefficients of a polynomial chaos expansion using the singular value decomposition. When the number of model runs exceeds the number of terms in the PCE, the solution returned will be the least-squares solution, otherwise the solution will be the minimum norm solution computed using the pseudo-inverse.

- [expansion_order](#)
- [collocation_points](#)
- [least_absolute_shrinkage](#)
- [noise_tolerance](#)

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

Specification

Alias: none

Argument(s): REALLIST

Default: 1e-3 for BPDN, 0. otherwise (algorithms run until termination)

Description

The noise tolerance used when performing cross validation in the presence of noise or truncation errors.

7.2.68.1.4.54 l_2 _penalty

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.68.1.4.55 cross_validation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.68.1.4.56 [noise_only](#)

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.1.4.57 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.1.4.58 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces samples = 2N). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.1.4.59 response_scaling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to [0,1] based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

These keywords may also be of interest:

- [multifidelity_polynomial_chaos](#)
- [multifidelity_function_train](#)

7.2.68.1.4.60 use_derivatives

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.68.1.4.61 tensor_grid

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.62 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [max_solver_iterations](#)

Maximum iterations in determining polynomial coefficients

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

When using an iterative polynomial coefficient estimation approach, e.g., cross-validation-based solvers, limits the maximum iterations in the coefficient solver.

7.2.68.1.4.64 collocation_ratio

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)

- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.

Specification

Alias: none

Argument(s): REAL

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Regression Algorithm (Group 1)	least_squares	Compute the coefficients of a polynomial expansion using least squares
			orthogonal_matching_pursuit	Compute the coefficients of a polynomial expansion using orthogonal matching pursuit (OMP)
			basis_pursuit	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit ℓ_1 -minimization problem using linear programming.
			basis_pursuit_denoising	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit Denoising ℓ_1 -minimization problem using second order cone optimization.

		least_angle_regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
		least_absolute_shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.
	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.
	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

	Optional	max_solver_ - iterations	Maximum iterations in determining polynomial coefficients
--	-----------------	--	---

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p, the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

7.2.68.1.4.65 least_squares

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [least_squares](#)

Compute the coefficients of a polynomial expansion using least squares

Specification

Alias: none

Argument(s): none

Default: svd

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	LSQ Regression Approach (Group 1)	svd	Calculate the coefficients of a polynomial chaos expansion using the singular value decomposition.

			equality_-constrained	Calculate the coefficients of a polynomial chaos expansion using equality constrained least squares.
--	--	--	---------------------------------------	--

Description

Compute the coefficients of a polynomial expansion using least squares. Specifically SVD-based least-squares will be used for solving over-determined systems. For the situation when the number of function values is smaller than the number of terms in a PCE, but the total number of samples including gradient values is greater than the number of terms, the resulting over-determined system will be solved using equality constrained least squares

- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.1.4.80 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.1.4.81 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces samples = $2N$). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.1.4.82 `response_scaling`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to $[0,1]$ based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

See Also

These keywords may also be of interest:

- [multifidelity_polynomial_chaos](#)
- [multifidelity_function_train](#)

7.2.68.1.4.83 `use_derivatives`

- [Keywords Area](#)

- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)

- [expansion_order](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.68.1.4.84 `tensor_grid`

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.85 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [expansion_samples](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.89 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.1.4.90 custom_annotated

- [Keywords Area](#)
- [method](#)

- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9          1.1          0.0002          0.26          0.76
2             0.90009      1.1 0.0001996404857  0.2601620081    0.759955
3             0.89991      1.1 0.0002003604863  0.2598380081    0.760045
...
```

- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002      0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.1.4.95 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.1.4.96 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)

- [expansion_order](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.1.4.97 `posterior_adaptive`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```
bayes_calibration queso
  chain_samples = 2000 seed = 348
  delayed_rejection
  emulator
    gaussian_process surfpack build_samples = 30
    posterior_adaptive max_iterations = 10
    proposal_covariance derivatives
```

7.2.68.1.4.98 orthogonal_least_interpolation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: least_interpolation oli

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points	Number of collocation points used to estimate expansion coefficients
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models. File containing points you wish to use to build a surrogate
	Optional	import_build_points_file	
	Optional	posterior_adaptive	Adapt emulator model to increase accuracy in high posterior probability regions

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.102 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

	Optional	active_only	Import only active variables from tabular data file
--	-----------------	-----------------------------	---

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.1.4.103 custom_annotated

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```

%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1             0.9        1.1         0.0002         0.26           0.76
2             0.90009    1.1 0.0001996404857  0.2601620081   0.759955

- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID           0.9          1.1          0.0002          0.26          0.76

7.2.68.1.4.108 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045

```

7.2.68.1.4.109 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.1.4.110 posterior_adaptive

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```
bayes_calibration queso
chain_samples = 2000 seed = 348
delayed_rejection
emulator
  gaussian_process surfpack build_samples = 30
  posterior_adaptive max_iterations = 10
  proposal_covariance derivatives
```

7.2.68.1.4.111 askey

- [emulator](#)
- [pce](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

Sample allocation approach for multilevel expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Multilevel Sample Allocation Control (Group 1)	Dakota Keyword estimator_variance	Dakota Keyword Description Variance of mean estimator within multilevel polynomial chaos
			rip_sampling	Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Description

Multilevel expansions, including regression-based polynomial chaos expansion (PCE) and function train (FT) expansions, require a sample allocation strategy. Three options are currently available:

- allocation based on assuming a convergence rate for the estimator variance (for regression PCE)
- restricted isometry property (RIP) sampling (for regression PCE via compressed sensing)
- rank sampling (for FT)

Default Behavior

Current defaults, when `allocation_control` is not specified, are estimator variance for PCE and rank sampling for FT.

7.2.68.1.4.119 `estimator_variance`

- [method](#)
- [bayes_calibration](#)
- [queso](#)

- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [estimator_variance](#)

Variance of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		estimator_rate	Rate of convergence of mean estimator within multilevel polynomial chaos

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ , with default values that may be overridden as part of this specification block.

This approach is supported for regression-based PCE approaches (over-determined least squares, under-determined compressed sensing, or orthogonal least interpolation).

In practice, it can be challenging to estimate a smooth convergence rate for estimator variance in the presence of abrupt transitions in the quality of sparse recoveries. As a result, sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the convergence of the estimator variance, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```

method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
  orthogonal_matching_pursuit
  expansion_order_sequence = 2
  pilot_samples = 10
  collocation_ratio = .9
  allocation_control
  estimator_variance estimator_rate = 2.5
  seed = 1237
  convergence_tolerance = .01

```

7.2.68.1.4.120 estimator_rate

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [estimator_variance](#)
- [estimator_rate](#)

Rate of convergence of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): REAL

Default: 2

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ .

The default values are $\gamma = 1$ and $\kappa = 2$ (adopts a more aggressive sample profile by assuming a faster convergence rate than Monte Carlo). This advanced specification option allows to user to specify κ , overriding the default.

7.2.68.1.4.121 rip_sampling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [rip_sampling](#)

Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multilevel polynomial chaos with compressed sensing may allocate the number of samples per level based on the restricted isometry property (RIP), applied to recovery at level l :

$$N_l \geq s_l \log^3(s_l) L_l \log(C_l)$$

for sparsity s , cardinality C , and mutual coherence L . The adaptive algorithm starts from a pilot sample, shapes the profile based on observed sparsity, and iterates until convergence. In practice, RIP sampling levels are quite conservative, and a collocation ratio constraint ($N_l \leq rC_l$, where r defaults to 2) must be enforced on the profile.

The algorithm relies on observed sparsity, it is appropriate for use with regularized solvers for compressed sensing. It employs orthogonal matching pursuit (OMP) by default and automatically activates cross-validation in order to choose the best noise parameter value for the recovery.

This capability is **experimental**. Sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the number of sparse coefficient sets recovered for each level, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```
method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
    orthogonal_matching_pursuit
    expansion_order_sequence = 2
    pilot_samples = 10
    collocation_ratio = .9
    allocation_control rip_sampling
    seed = 1237
    convergence_tolerance = .01
```

- [emulator](#)
- [ml_pce](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Discrepancy Emulation Approach (Group 1)	Dakota Keyword distinct	Dakota Keyword Description Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,  
  multilevel_polynomial_chaos  
  expansion_order_sequence = 2  
  collocation_ratio = .9  
  orthogonal_matching_pursuit  
  discrepancy_emulation recursive
```

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		advancements	The maximum number of steps used to expand a basis step.
	Optional		soft_convergence_limit	The maximum number of times no improvement in cross validation error is allowed before the algorithm is terminated.

Description

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion. Basis selection uses compressed sensing to identify a initial set of non zero PCE coefficients. Then these non-zero terms are expanded a set number of times (we suggest 3) and compressed sensing is then applied to these three new index sets. Cross validation is used to choose the best candidate basis. The best basis is then restricted again to the non-zero terms and expanded until no improvement can be gained by adding additional terms.

		least_angle_-regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
		least_absolute_-shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.
	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional	max_solver_iterations	Maximum iterations in determining polynomial coefficients

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.68.1.4.148 cross_validation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.68.1.4.149 noise_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)

- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.1.4.150 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.1.4.151 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces samples = $2N$). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.1.4.152 response_scaling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to $[0,1]$ based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

See Also

These keywords may also be of interest:

- [multifidelity_polynomial_chaos](#)

- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)

- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.68.1.4.154 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.155 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.159 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification**Alias:** import_points_file**Argument(s):** STRING**Default:** no point import from a file**Child Keywords:**

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4

7.2.68.1.4.160 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)

- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1             0.9          1.1          0.0002      0.26          0.76

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002      0.26          0.76

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)

- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.1.4.167 `orthogonal_least_interpolation`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: `least_interpolation` `oli`

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points_sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

7.2.68.1.4.168 `collocation_points_sequence`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

See Also

These keywords may also be of interest:

- [collocation_points](#)

7.2.68.1.4.169 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.170 `reuse_points`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)

- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.171 `import_build_points_file`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional <i>(Choose One)</i>	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.1.4.172 `custom_annotated`

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [ml_pce](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

- [emulator](#)
- [ml_pce](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

- [allocation_control](#)

Sample allocation approach for multifidelity expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multifidelity Sample Allocation Control (Group 1)	greedy	Sample allocation based on greedy refinement within multifidelity polynomial chaos

Description

Multifidelity surrogate approaches, including polynomial chaos, stochastic collocation, and function train, can optionally employ an integrated greedy competition across the model sequence, where each model index can supply one or more refinement candidates which are competed to determine the candidate with the greatest impact on the QoI statistics per unit cost. This greedy competition implicitly determines the optimal sample allocation across model indices.

Default Behavior

The default, when `allocation_control` is not specified, is to compute or adapt separately for each model index (individual instead of integrated refinement).

7.2.68.1.4.194 [greedy](#)

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [allocation_control](#)
- [greedy](#)

Sample allocation based on greedy refinement within multifidelity polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multifidelity polynomial chaos supports greedy refinement strategies, spanning regression and projection approaches for computing expansion coefficients. The key idea is that each level of the model hierarchy being approximated can generate one or more candidates for refinement. These candidates are competed against each other within a unified competition, and the candidate that induces the largest change in the statistical QoI (response covariance by default, or results of any $z/p/\beta/\beta^*$ level mappings when specified), normalized by relative cost of evaluating the candidate, is selected and then used to generate additional candidates for consideration at its model level.

Examples

The following example of greedy multifidelity regression starts from a zeroth-order reference expansion (a constant) for each level, and generates candidate refinements for each level that are competed in an integrated greedy competition. The number of new samples for the incremented candidate expansion order is determined from the collocation ratio. In this case, the number of candidates for each level is limited to one uniform refinement of the current expansion order.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement uniform
  expansion_order_sequence = 0
  collocation_ratio = .9 seed = 160415
  orthogonal_matching_pursuit
  convergence_tolerance 1.e-2
```

The next example employs generalized sparse grids within a greedy multifidelity competition. Each modeling level starts from a level 0 reference grid (a single point) and generates multiple admissible index set candidates. The full set of candidates across all model levels is competed within an integrated greedy competition, where the greedy selection metric is the induced change in the statistical QoI, normalized by the aggregate simulation cost of the index set candidate. In this case, there are multiple candidates for each model level and the number of candidates grows rapidly with random dimension and grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement dimension_adaptive generalized
  sparse_grid_level_sequence = 0 unrestricted
  convergence_tolerance 1.e-8
```

7.2.68.1.4.195 discrepancy_emulation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Discrepancy Emulation Approach (Group 1)	distinct	Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
  multilevel_polynomial_chaos
  expansion_order_sequence = 2
  collocation_ratio = .9
  orthogonal_matching_pursuit
  discrepancy_emulation recursive
```

- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

--	-----------------	--	---

Description

Each level entry of the `expansion_order_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support expansion order sequences include multilevel or multifidelity polynomial chaos.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [expansion_order](#)

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		advancements	The maximum number of steps used to expand a basis step.
	Optional		soft_convergence_limit	The maximum number of times no improvement in cross validation error is allowed before the algorithm is terminated.

Description

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion. Basis selection uses compressed sensing to identify a initial set of non zero PCE coefficients. Then these non-zero terms are expanded a set number of times (we suggest 3) and compressed sensing is then applied to these three new index sets. Cross validation is used to choose the best candidate basis. The best basis is then restricted again to the non-zero terms and expanded until no improvement can be gained by adding additional terms.

	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional	max_solver_iterations	Maximum iterations in determining polynomial coefficients

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.68.1.4.231 cross_validation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.68.1.4.232 noise_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)

- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.1.4.233 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.1.4.234 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces samples = $2N$). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.1.4.235 response_scaling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to $[0,1]$ based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)

- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.68.1.4.237 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.238 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [expansion_order_sequence](#)
- [expansion_samples_sequence](#)

Sequence of expansion samples used in a multi-stage polynomial chaos expansion

Each level entry of the `expansion_samples_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support expansion samples sequences include multilevel and multifidelity polynomial chaos.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [expansion_samples](#)

Specification

Alias: none

Argument(s): INTEGERLIST

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [expansion_samples_sequence](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.242 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification**Alias:** import_points_file**Argument(s):** STRING**Default:** no point import from a file**Child Keywords:**

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.1.4.243 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)

- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)

- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002      0.26          0.76

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9          1.1          0.0002          0.26          0.76

```

7.2.68.1.4.248 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.1.4.249 active_only

- [queso](#)
- [emulator](#)
- [mf_pce](#)

- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.1.4.250 `orthogonal_least_interpolation`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: `least_interpolation` `oli`

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points_sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

7.2.68.1.4.251 `collocation_points_sequence`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

See Also

These keywords may also be of interest:

- [collocation_points](#)

7.2.68.1.4.252 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.1.4.253 `reuse_points`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)

- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.1.4.254 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...

```

7.2.68.1.4.261 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.1.4.262 askey

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_pce](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

- [mf_pce](#)
- [wiener](#)

Use standard normal random variables (along with Hermite orthogonal basis polynomials) when transforming to a standardized probability space.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Wiener option employs standard normal random variables in a transformed probability space, corresponding to a Hermite orthogonal polynomial basis. This is the same nonlinear variable transformation used by local and global reliability methods (and therefore has the same variable support).

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.

			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.
--	--	--	------------------------------------	--

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

- [h_refinement](#)

Employ h-refinement to refine the grid

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group h-refinement Type (Group 1)	Dakota Keyword uniform	Dakota Keyword Description Refine an expansion uniformly in all dimensions.
			dimension_-adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.
			local_adaptive	Planned future capability for local pointwise refinement within a generalized sparse grid.

Description

Automated expansion refinement can be selected as either `p_refinement` or `h_refinement`, and either refinement specification can be either `uniform` or `dimension_adaptive`. The `dimension_adaptive` case can be further specified as either `sobol` or `generalized` (decay not supported). Each of these automated refinement approaches makes use of the `max_iterations` and `convergence_tolerance` iteration controls. The `h_refinement` specification involves use of the same piecewise interpolants (linear or cubic Hermite splines) described above for the piecewise specification option (it is not necessary to redundantly specify `piecewise` in the case of `h_refinement`). In future releases, the hierarchical interpolation approach will enable local refinement in addition to the current `uniform` and `dimension_adaptive` options.

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [sc](#)
- [quadrature_order](#)

Order for tensor-products of Gaussian quadrature rules

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		dimension_preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order`, and, optionally, `dimension_preference`). The default rule selection is to employ `non_nested` Gauss rules including Gauss-Hermite (for normals or transformed normals), Gauss-Legendre (for uniforms or transformed uniforms), Gauss-Jacobi (for betas), Gauss-Laguerre (for exponentials), generalized Gauss-Laguerre (for gammas), and numerically-generated Gauss rules (for other distributions when using an Extended basis). For the case of `p_refinement` or the case of an explicit `nested` override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse. By specifying a `dimension_preference`,

where higher preference leads to higher order polynomial resolution, the tensor grid may be rendered anisotropic. The dimension specified to have highest preference will be set to the specified `quadrature_order` and all other dimensions will be reduced in proportion to their reduced preference; any non-integral portion is truncated. To synchronize with tensor-product integration, a tensor-product expansion is used, where the order p_i of the expansion in each dimension is selected to be half of the integrand precision available from the rule in use, rounded down. In the case of non-nested Gauss rules with integrand precision $2m_i - 1$, p_i is one less than the quadrature order m_i in each dimension (a one-dimensional expansion contains the same number of terms, $p + 1$, as the number of Gauss points). The total number of terms, N , in a tensor-product expansion involving n uncertain input variables is

$$N = 1 + P = \prod_{i=1}^n (p_i + 1)$$

In some advanced use cases (e.g., multifidelity UQ), multiple grid resolutions can be employed; for this reason, the `quadrature_order` specification supports an array input.

A corresponding sequence specification is documented at, e.g., [quadrature_order_sequence](#) and [quadrature_order_sequence](#)

	Optional (<i>Choose One</i>)	Quadrature Rule Growth (Group 2)	restricted	Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.
			unrestricted	Override the default restriction of growth rates for nested and non-nested rules that are by default synchronized for consistency.
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 3)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multi-dimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level` and, optionally, `dimension_preference`). The underlying one-dimensional integration rules are the same as for the tensor-product quadrature case; however, the default rule selection is nested for sparse grids (Genz-Keister for normals/transformed normals and Gauss-Patterson for uniforms/transformed uniforms). This default can be overridden with an explicit `non_nested` specification (resulting in Gauss-Hermite for normals/transformed normals and Gauss-Legendre for uniforms/transformed uniforms). As for tensor quadrature, the `dimension_preference` specification enables the use of anisotropic sparse grids (refer to the PCE description in the User's Manual for the anisotropic index set constraint definition). Similar to anisotropic tensor grids, the dimension with greatest preference will have resolution at the full `sparse_grid_level` and all other dimension resolutions will be reduced in proportion to their reduced preference. For PCE with either isotropic or anisotropic sparse grids, a summation of tensor-product expansions is used, where each anisotropic tensor-product quadrature rule underlying the sparse grid construction results in its own anisotropic tensor-product expansion as described in case 1. These anisotropic tensor-product expansions are summed into a sparse PCE using the standard Smolyak summation (again, refer to the User's Manual for additional details). As for `quadrature_order`, the `sparse_grid_level` specification admits an array input for enabling specification of multiple grid resolutions used by certain advanced solution methodologies.

A corresponding sequence specification is documented at, e.g., [sparse_grid_level_sequence](#) and [sparse_grid_level_sequence](#)

Employ a nodal sparse grid construction in stochastic collocation

Specification

Alias: none

Argument(s): none

Default: nodal

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The nodal formulation does not require nested interpolation rules and is therefore more generally applicable. However, in the context of adaptive refinement, it can suffer from loss of precision due to subtractive cancellation.

7.2.68.1.4.288 hierarchical

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [sc](#)
- [sparse_grid_level](#)
- [hierarchical](#)

Employ a hierarchical sparse grid construction

Specification

Alias: none

Argument(s): none

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The hierarchical formulation requires nested interpolation rules as it utilizes increments in collocation points along with hierarchical weights defined from a hierarchical basis formulation.

This keyword requests the hierarchical formulation, which has benefits for adaptive refinement by supporting direct computation of increments in targeted statistics (e.g. mean, covariance, reliability indices), avoiding loss of precision from subtractive cancellation.

7.2.68.1.4.289 restricted

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [sc](#)
- [sparse_grid_level](#)
- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.68.1.4.293 `piecewise`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [sc](#)
- [piecewise](#)

Use piecewise local basis functions

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

SC also supports the option of piecewise local basis functions. These are piecewise linear splines, or in the case of gradient-enhanced interpolation via the `use_derivatives` specification, piecewise cubic Hermite splines. Both of these basis selections provide local support only over the range from the interpolated point to its nearest 1D neighbors (within a tensor grid or within each of the tensor grids underlying a sparse grid), which exchanges the fast convergence of global bases for smooth functions for robustness in the representation of nonsmooth response functions (that can induce Gibbs oscillations when using high-order global basis functions). When local basis functions are used, the usage of nonequidistant collocation points (e.g., the Gauss point selections described above) is not well motivated, so equidistant Newton-Cotes points are employed in this case, and all random variable types are transformed to standard uniform probability space.

7.2.68.1.4.294 `askey`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [sc](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group h-refinement Type (Group 1)	Dakota Keyword uniform	Dakota Keyword Description Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.
			local_adaptive	Planned future capability for local pointwise refinement within a generalized sparse grid.

Description

Automated expansion refinement can be selected as either p_refinement or h_refinement, and either refinement specification can be either uniform or dimension_adaptive. The dimension_adaptive case can be further specified as either sobol or generalized (decay not supported). Each of these automated refinement approaches makes use of the max_iterations and convergence_tolerance iteration controls. The h_refinement specification involves use of the same piecewise interpolants (linear or cubic Hermite splines) described above for the piecewise specification option (it is not necessary to redundantly specify piecewise in the case of h_refinement). In future releases, the hierarchical interpolation approach will enable local refinement in addition to the current uniform and dimension_adaptive options.

Sample allocation approach for multifidelity expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multifidelity Sample Allocation Control (Group 1)	greedy	Sample allocation based on greedy refinement within multifidelity stochastic collocation

Description

Multifidelity surrogate approaches, including polynomial chaos, stochastic collocation, and function train, can optionally employ an integrated greedy competition across the model sequence, where each model index can supply one or more refinement candidates which are competed to determine the candidate with the greatest impact on the QoI statistics per unit cost. This greedy competition implicitly determines the optimal sample allocation across model indices.

Default Behavior

The default, when `allocation_control` is not specified, is to compute or adapt separately for each model index (individual instead of integrated refinement).

7.2.68.1.4.313 greedy

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [allocation_control](#)
- [greedy](#)

Sample allocation based on greedy refinement within multifidelity stochastic collocation

Specification

Alias: none

Argument(s): none

Description

Multifidelity stochastic collocation supports greedy refinement strategies using tensor and sparse grids for both nodal and hierarchical collocation approaches. The key idea is that each level of the model hierarchy being approximated can generate one or more candidates for refinement. These candidates are competed against each other within an integrated competition, and the candidate that induces the largest change in the statistical QoI (response covariance by default, or results of any level mappings when specified), normalized by relative cost of evaluating the candidate, is selected and then used to generate additional candidates for consideration at its model level.

Examples

The following example of greedy multifidelity stochastic collocation using nodal interpolation starts from a zeroth-order expansion (a constant) for each level, and generates uniform candidate refinements for each level that are competed in a greedy competition. The number of new samples for the incremented candidate expansion order is determined from the quadrature rules of the new sparse grid level. In this case, the number of candidates for each level is limited to one uniform refinement of the current sparse grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_stoch_collocation
    nodal
    allocation_control greedy
    p_refinement uniform
    sparse_grid_level_sequence = 0 unrestricted
    convergence_tolerance 1.e-3
```

The next example employs generalized sparse grids and hierarchical interpolation. Each level starts from a level 0 reference grid (a single point) and generates multiple admissible index set candidates. The full set of candidates across all levels is competed within a unified greedy competition, where the greedy selection metric is the induced change in the statistical QoI, normalized by the aggregate simulation cost of the index set candidate. In this case, there are multiple candidates for each level and the number of candidates grows rapidly with random dimension and grid level.

```

method,
  model_pointer = 'HIERARCH'
  multifidelity_stoch_collocation
  hierarchical
  allocation_control greedy
  p_refinement dimension_adaptive generalized
  sparse_grid_level_sequence = 0 unrestricted
  convergence_tolerance 1.e-8

```

7.2.68.1.4.314 discrepancy_emulation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Discrepancy Emulation Approach (Group 1)	Dakota Keyword distinct	Dakota Keyword Description Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
  multilevel_polynomial_chaos
  expansion_order_sequence = 2
  collocation_ratio = .9
  orthogonal_matching_pursuit
  discrepancy_emulation recursive

- [quadrature_order_sequence](#)

Sequence of quadrature orders used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional		dimension_ - preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Each level entry of the `quadrature_order_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support quadrature order sequences include multilevel polynomial chaos, multifidelity polynomial chaos, or multifidelity stochastic collocation expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [quadrature_order](#)

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [sparse_grid_level_sequence](#)
- [nodal](#)

Employ a nodal sparse grid construction in stochastic collocation

Specification

Alias: none

Argument(s): none

Default: nodal

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The nodal formulation does not require nested interpolation rules and is therefore more generally applicable. However, in the context of adaptive refinement, it can suffer from loss of precision due to subtractive cancellation.

7.2.68.1.4.324 hierarchical

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [sparse_grid_level_sequence](#)
- [hierarchical](#)

Employ a hierarchical sparse grid construction

Specification

Alias: none

Argument(s): none

Description

Stochastic collocation with sparse grids can employ either a nodal or hierarchical formulation. The hierarchical formulation requires nested interpolation rules as it utilizes increments in collocation points along with hierarchical weights defined from a hierarchical basis formulation.

This keyword requests the hierarchical formulation, which has benefits for adaptive refinement by supporting direct computation of increments in targeted statistics (e.g. mean, covariance, reliability indices), avoiding loss of precision from subtractive cancellation.

7.2.68.1.4.325 restricted

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [sparse_grid_level_sequence](#)
- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

7.2.68.1.4.326 `unrestricted`

7.2.68.1.4.329 `piecewise`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [piecewise](#)

Use piecewise local basis functions

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

SC also supports the option of piecewise local basis functions. These are piecewise linear splines, or in the case of gradient-enhanced interpolation via the `use_derivatives` specification, piecewise cubic Hermite splines. Both of these basis selections provide local support only over the range from the interpolated point to its nearest 1D neighbors (within a tensor grid or within each of the tensor grids underlying a sparse grid), which exchanges the fast convergence of global bases for smooth functions for robustness in the representation of nonsmooth response functions (that can induce Gibbs oscillations when using high-order global basis functions). When local basis functions are used, the usage of nonequidistant collocation points (e.g., the Gauss point selections described above) is not well motivated, so equidistant Newton-Cotes points are employed in this case, and all random variable types are transformed to standard uniform probability space.

7.2.68.1.4.330 `askey`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surpack Gaussian process).

However, it's use with Surpack Gaussian process is not recommended.

7.2.68.1.4.333 diagonal_covariance

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: `diagonal_covariance` for response vector > 10 ; else `full_covariance`

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.68.1.4.334 `full_covariance`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [emulator](#)
- [mf_sc](#)
- [full_covariance](#)

Display the full covariance matrix

Specification

Alias: none

Argument(s): none

Description

With a large number of responses, the covariance matrix can be very large. `full_covariance` is used to force Dakota to output the full covariance matrix.

7.2.68.1.5 `standardized_space`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [standardized_space](#)

Perform Bayesian inference in standardized probability space

Specification

Alias: none

Argument(s): none

Description

This option transforms the inference process (MCMC sampling and any emulator model management) into a standardized probability space.

The variable transformations performed are as described in [askey](#).

Default Behavior

The default for the Gaussian process and no emulator options is to perform inference in the original probability space (no transformation). Polynomial chaos and stochastic collocation emulators, on the other hand, are always formed in standardized probability space, such that the inference process is also performed in this standardized space.

Expected Output

The user will see the truth model evaluations performed in the original space, whereas any method diagnostics relating to the MCMC samples (e.g., QUESO data in the outputData directory) will report points and response data (response gradients and Hessians, if present, will differ but response values will not) that correspond to the transformed space.

Usage Tips

Selecting `standardized_space` generally has the effect of scaling the random variables to be of comparable magnitude, which can improve the efficiency of the Bayesian inference process.

Examples

```
method,
    bayes_calibration queso
    samples = 2000 seed = 348
    dram
    standardized_space
```

7.2.68.1.6 logit_transform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [logit_transform](#)

Utilize the logit transformation to reduce sample rejection for bounded domains

Specification

Alias: none

Argument(s): none

Description

The logit transformation performs an internal variable transformation from bounded domains to unbounded domains in order to reduce sample rejection due to an out-of-bounds condition.

Default Behavior

This option is experimental at present, and is therefore defaulted off.

Usage Tips

This option can be helpful when regions of high posterior density exist in the corners of a multi-dimensional bounded domain. In these cases, it may be difficult to generate feasible samples from the proposal density, such that transformation to unbounded domains may greatly reduce sample rejection rates.

Examples

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  dram
  logit_transform
```

7.2.68.1.7 export_chain_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [export_chain_points_file](#)

Export the MCMC chain to the specified filename

Specification

Alias: none

Argument(s): STRING

Default: chain export to default filename

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

The filename to which the final MCMC posterior chain will be exported.

Default Behavior No export to file.

Expected Output

A tabular data file will be produced in the specified format (annotated by default) containing samples from the posterior distribution.

Usage Tips

Additional Discussion

7.2.68.1.7.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [export_chain_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and `(fully) annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76

- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955

...
```

7.2.68.1.7.6 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [export_chain_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76

7.2.68.1.8 dram

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [dram](#)

Use the DRAM MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

The type of Markov Chain Monte Carlo used. This keyword specifies the use of DRAM, (Delayed Rejection Adaptive Metropolis) [40].

Default Behavior

Five MCMC algorithm variants are supported: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Usage Tips

If the user knows very little about the proposal covariance, using `dram` is a recommended strategy. The proposal covariance is adaptively updated, and the delayed rejection may help improve low acceptance rates.

Examples

```
method,
  bayes_calibration queso
  dram
  samples = 10000 seed = 348
```

7.2.68.1.9 `delayed_rejection`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [delayed_rejection](#)

Use the Delayed Rejection MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: `dram`

Description

This keyword specifies the use of the Delayed Rejection algorithm in which there can be a delay in rejecting samples from the chain. That is, the "DR" part of DRAM is used but the "AM" part is not, rather a regular Metropolis-Hastings algorithm is used.

Default Behavior

Five MCMC algorithm variants are supported: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Usage Tips

If the user knows something about the proposal covariance or the proposal covariance is informed through derivative information, using `delayed_rejection` is preferred over `dram`: the proposal covariance is already being informed by derivative information and the adaptive metropolis is not necessary.

Examples

```
method,
  bayes_calibration queso
  delayed_rejection
  samples = 10000 seed = 348
```

See Also

These keywords may also be of interest:

- [proposal_covariance](#)

7.2.68.1.10 adaptive_metropolis

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [adaptive_metropolis](#)

Use the Adaptive Metropolis MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

This keyword specifies the use of the Adaptive Metropolis algorithm. That is, the "AM" part of DRAM is used but the "DR" part is not: specifying this keyword activates only the Adaptive Metropolis part of the MCMC algorithm, in which the covariance of the proposal density is updated adaptively.

Default Behavior

Five MCMC algorithm variants are supported in QUESO: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Four MCMC variants are currently supported in MUQ: `dram`, `delayed_rejection`, `metropolis_hastings` and `adaptive_metropolis`.

Usage Tips

If the user knows very little about the proposal covariance, but doesn't want to incur the cost of using full dram with both delayed rejection and adaptive metropolis, specifying only `adaptive_metropolis` offers a good strategy.

Examples

```
method,
  bayes_calibration queso
  adaptive_metropolis
  samples = 10000 seed = 348
```

7.2.68.1.11 metropolis_hastings

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [metropolis_hastings](#)

Use the Metropolis-Hastings MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

This keyword specifies the use of a Metropolis-Hastings algorithm for the MCMC chain generation. This means there is no delayed rejection and no adaptive proposal covariance updating as in DRAM.

Default Behavior

Five MCMC algorithm variants are supported currently in QUESO: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Four MCMC algorithm variants are currently supported in MUQ: `dram`, `delayed_rejection`, `metropolis_hastings` and `adaptive_metropolis`.

Usage Tips

If the user wants to use Metropolis-Hastings, possibly as a comparison to the other methods which involve more chain adaptation, this is the MCMC type to use.

Examples

```
method,
  bayes_calibration queso
  metropolis_hastings
  samples = 10000 seed = 348
```

7.2.68.1.12 multilevel

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [multilevel](#)

Use the multilevel MCMC algorithm.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

Selects the multilevel algorithm described in [73].

Default Behavior

Five MCMC algorithm variants are supported: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Usage Tips

The multilevel algorithm is a more experimental algorithm than the other MCMC approaches mentioned above. It works well in cases where the prior can be "evolved" to a posterior in a structured way. Currently, the multilevel option is not in production form.

Examples

```
method,
  bayes_calibration queso
  multilevel
  samples = 10000 seed = 348
```

7.2.68.1.13 pre_solve

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [pre_solve](#)

Perform deterministic optimization for MAP before Bayesian calibration

Specification

Alias: none

Argument(s): none

Default: nip pre-solve for emulators

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Pre-solve Optimizer (Group 1)	Dakota Keyword	Dakota Keyword Description
			sqp	Uses a sequential quadratic programming method for underlying optimization
			nip	Uses a nonlinear interior point method for underlying optimization
			none	Deactivates MAP pre-solve prior to initiating the MCMC process.

Description

When specified, Dakota will perform a deterministic derivative-based optimization to maximize the log posterior (minimize the negative log posterior = misfit - log_prior + constant normalization factors). The Markov chain in Bayesian calibration will subsequently be started at the best point found in the optimization (the MAP point), which can eliminate the need for "burn in" of the chain in which some initial portion of the chain is discarded. Note that both optimization methods available ([sqp](#) and [nip](#)) require derivatives of the negative log posterior, either first-order in the case of SQP (with quasi-Newton Hessians from secant updates) or second-order in the case of full-Newton NIP (with explicit Hessian use). The derivatives will be computed from the same model used for the MCMC process; e.g. if an emulator is used, the emulator derivatives will be used, otherwise they will be based on the user's model specification for the model.

It is important to clarify that the use of the Hessian of the negative log posterior within a full Newton solver does not strictly require Hessians from the model response quantities of interest (QoIs). Rather, the Hessian of the negative log posterior is formed from an exact Hessian of the negative log prior and a misfit Hessian that can be either exact or approximated: the full misfit Hessian can be formed using QoI residuals, gradients, and Hessians or the

Gauss-Newton approximate misfit Hessian can be formed using only QoI gradients [16]. This Hessian composition is configured automatically based on MAP solver selection and the emulator's or simulation model's support for derivatives.

Default Behavior The default MAP pre-solve behavior depends on the use of an emulator model within the inference process.

If there is an emulator (for which derivatives are easily computed), then the MAP pre-solve is active by default and a full Newton NIP formulation is selected if OPT++ is available. The default use of a MAP pre-solve can be overridden using "pre_solve none" and the default selection of OPT++ full Newton NIP can be replaced with NPSOL SQP using "pre_solve sqp." Depending on the emulator's support for derivatives of the simulated QoI (gradients for dakota GP and stochastic collocation; gradients and Hessians for surpack GP and polynomial chaos), the contribution of the misfit Hessian to the Hessian of the negative log posterior will be computed either using the full misfit Hessian or its Gauss-Newton approximation (refer to Bayesian chapter in [16]).

If no emulator model is specified, then the pre-solve is bypassed by default and the MCMC chain is initiated from user-specified (or default) initial value for the prior distributions of the random variables. This default can be overridden by specifying "pre_solve nip" for a full Newton NIP solution or "pre_solve sqp" for an NPSOL SQP solution. Both MAP pre-solve approaches require QoI gradients from the simulation model, and the full Newton approach can further leverage QoI Hessians when available (though not required due to the Gauss-Newton approximation, as explained previously).

Expected Output When pre-solve is enabled, the output will include a deterministic optimization, followed by a Bayesian calibration. The final results will include the MAP point as well as posterior statistics from the MCMC chain. The MAP point that is reported is the point with highest posterior probability spanning both the pre-solve and the subsequent MCMC chain; it will most commonly reflect the end state of the pre-solve, although it can reflect subsequent improvements from the chain evolution, should they occur.

Examples

```
method
  bayes_calibration queso
  samples = 2000 seed = 348
  delayed_rejection
  emulator
    pce sparse_grid_level = 2
    pre_solve nip # default for emulators
```

7.2.68.1.13.1 sqp

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [pre_solve](#)
- [sqp](#)

Uses a sequential quadratic programming method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `sqp` keyword directs Dakota to use a sequential quadratic programming method to solve that problem. A sequential quadratic programming solves a sequence of linearly constrained quadratic optimization problems to arrive at the solution to the optimization problem.

7.2.68.1.13.2 `nip`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [pre_solve](#)
- [nip](#)

Uses a nonlinear interior point method for underlying optimization

Specification

Alias: none

Argument(s): none

Description

Many uncertainty quantification methods solve a constrained optimization problem under the hood. The `nip` keyword directs Dakota to use a nonlinear interior point to solve that problem. A nonlinear interior point method traverses the interior of the feasible region to arrive at the solution to the optimization problem.

7.2.68.1.13.3 `none`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [pre_solve](#)
- [none](#)

Deactivates MAP pre-solve prior to initiating the MCMC process.

Specification

Alias: none

Argument(s): none

Description

Pre-solving for the maximum a posteriori probability (MAP) point could be undesirable when testing MCMC performance or too expensive to pursue in some settings. The option "none" provides an override that deactivates the pre-solve option for cases where it would normally be active by default (e.g., for emulator models).

7.2.68.1.14 proposal_covariance

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)

Defines the technique used to generate the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Proposal Covariance Source (Group 1)	prior	Uses the covariance of the prior distributions to define the MCMC proposal covariance.
			derivatives	Use derivatives to inform the MCMC proposal covariance.
			values	Specifies matrix values to use as the MCMC proposal covariance.

			filename	Uses a file to import a user-specified MCMC proposal covariance.
--	--	--	--------------------------	--

Description

The proposal covariance is used to define a multivariate normal (MVN) jumping distribution used to create new points within a Markov chain. That is, a new point in the chain is determined by sampling within a MVN probability density with prescribed covariance that is centered at the current chain point. The accuracy of the proposal covariance has a significant effect on rejection rates and the efficiency of chain mixing.

Default Behavior

The default proposal covariance is `prior` when no emulator is present; `derivatives` when an emulator is present.

Expected Output

The effect of the proposal covariance is reflected in the MCMC chain values and the rejection rates, which can be seen in the diagnostic outputs from the QUESO solver within the `QuesoDiagnostics` directory.

Usage Tips

When derivative information is available inexpensively (e.g., from an emulator model), the derived-based proposal covariance forms a more accurate proposal distribution, resulting in lower rejection rates and faster chain mixing.

7.2.68.1.14.1 `prior`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [prior](#)

Uses the covariance of the prior distributions to define the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		multiplier	Multiplier to scale prior variance

Description

This keyword selection results in definition of the MCMC proposal covariance from the covariance of the prior distributions. This covariance is currently assumed to be diagonal without correlation.

Default Behavior

This is the default `proposal_covariance` option.

Usage Tips

Since this proposal covariance is defined globally, the chain does not need to be periodically restarted using local updates to this proposal. However, it is usually effective to adapt the proposal using one of the adaptive metropolis MCMC options.

Examples

```
method,
  bayes_calibration queso
    samples = 2000 seed = 348
  dram
  proposal_covariance prior
```

7.2.68.1.14.2 multiplier

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [prior](#)
- [multiplier](#)

Multiplier to scale prior variance

Specification

Alias: none

Argument(s): REAL

Default: 1.0

Description

The initial proposal covariance will be given by the prior variance times the multiplier.

Default Behavior When using prior-based proposal covariance, the default is to use the prior variance for the proposal (multiplier = 1.0)

Usage Tips

The prior variance may result in too tight or narrow a proposal covariance. The multiplier can be used to scale all entries of the prior variance in determining the initial proposal covariance.

Examples

```
method
  bayes_calibration queso
    samples = 2000 seed = 348
    dram
    proposal_covariance prior
    multiplier 0.1
```

7.2.68.1.14.3 derivatives

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [derivatives](#)

Use derivatives to inform the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		update_period	Period at which to update derivative-based proposal covariance

Description

This keyword selection results in definition of the MCMC proposal covariance from the Hessian of the misfit function (negative log likelihood), where this Hessian is defined from either a Gauss-Newton approximation (using only first derivatives of the calibration terms) or a full Hessian (using values, first derivatives, and second derivatives of the calibration terms). If this Hessian is indeterminate, it will be corrected as described in [16]

Default Behavior The default is `prior` based proposal covariance. This is a more advanced option that exploits structure in the form of the likelihood.

Expected Output

When derivatives are specified for defining the proposal covariance, the misfit Hessian and its inverse (the MVN proposal covariance) will be output to the standard output stream.

Usage Tips

The full Hessian of the misfit is used when either supported by the emulator in use (for PCE and surfpack GP, but not SC or dakota GP) or by the user's response specification (Hessian type is not "no_hessians"), in the case of no emulator. When this full Hessian is indefinite and cannot be inverted to form the proposal covariance, fallback to the positive semi-definite Gauss-Newton Hessian is employed.

Since this proposal covariance is locally accurate, it should be updated periodically using the `update_period` option. While the adaptive metropolis option can be used in combination with derivative-based preconditioning, it is generally preferable to instead decrease the proposal update period due to the improved local accuracy of this approach.

Examples

Generate a 2000 sample posterior chain, using derivatives to initialize the proposal covariance at the start of the chain.

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  delayed_rejection
  emulator pce sparse_grid_level = 2
  proposal_covariance derivatives
```

7.2.68.1.14.4 update_period

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [derivatives](#)
- [update_period](#)

Period at which to update derivative-based proposal covariance

Specification

Alias: none

Argument(s): INTEGER

Description

For derivative-based proposal covariance, this specifies the period (number of accepted MCMC samples) after which the proposal covariance is updated using derivative values at the current chain point.

Default Behavior

When `update_period` is not specified, derivatives will inform the proposal covariance at the start of the chain, but not updated further.

Usage Tips

The `update_period` should be tailored to the size of the total chain, accounting for the relative expense of derivative-based proposal updates.

Examples

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  delayed_rejection
  emulator pce sparse_grid_level = 2
  proposal_covariance derivatives
  update_period = 40 # update proposal covariance every 40 points
```

7.2.68.1.14.5 values

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [values](#)

Specifies matrix values to use as the MCMC proposal covariance.

Specification

Alias: none

Argument(s): REALLIST

Child Keywords:

	Required/Optional	Description of Group Values For (Group 1)	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)		diagonal	Specifies the diagonal matrix format when specifying a user-specified proposal covariance.

			matrix	Specifies the full matrix format when specifying a user-specified proposal covariance.
--	--	--	------------------------	--

Description

This keyword selection results in definition of the MCMC proposal covariance from user-specified matrix values. The matrix input format must be declared as either a full matrix or a matrix diagonal.

Default Behavior

This option is not the default, and generally implies special a priori knowledge from the user.

Usage Tips

This option is not supported for the case of transformations to standardized probability space.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  values ... # See leaf nodes for required format option
```

7.2.68.1.14.6 diagonal

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [values](#)
- [diagonal](#)

Specifies the diagonal matrix format when specifying a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When specifying the MCMC proposal covariance in an input file, this keyword declares the use of a diagonal matrix format, i.e., the user only provides the (positive) values along the diagonal.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
    diagonal values 1.0e6 1.0e-1
```

7.2.68.1.14.7 matrix

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [values](#)
- [matrix](#)

Specifies the full matrix format when specifying a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When specifying the MCMC proposal covariance in an input file, this keyword declares the use of a full matrix format, i.e., the user provides all values of the matrix, not just the diagonal. The matrix must be symmetric, positive-definite.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
    matrix values 1.0 0.1
                 0.1 2.0
```

7.2.68.1.14.8 filename

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [filename](#)

Uses a file to import a user-specified MCMC proposal covariance.

Specification

Alias: none

Argument(s): STRING

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Values For (Group 1)	Dakota Keyword diagonal	Dakota Keyword Description Specifies the diagonal matrix format when importing a user-specified proposal covariance.
			matrix	Specifies the full matrix format when importing a user-specified proposal covariance.

Description

This keyword selection results in definition of the MCMC proposal covariance from importing data a user-specified filename. This import must be declared as either a full matrix or a matrix diagonal.

Default Behavior

This option is not the default, and generally implies special a priori knowledge from the user.

Usage Tips

This option is not supported for the case of transformations to standardized probability space.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
    filename ... # See leaf nodes for required format option
```

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [filename](#)
- [diagonal](#)

Specifies the diagonal matrix format when importing a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When importing the MCMC proposal covariance from a user-specified filename, this keyword declares the use of a diagonal matrix format, i.e., the user only provides the (positive) values along the diagonal.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  diagonal filename 'dakota_cantilever_queso.diag.dat'
```

7.2.68.1.14.10 matrix

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [proposal_covariance](#)
- [filename](#)
- [matrix](#)

Specifies the full matrix format when importing a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When importing the MCMC proposal covariance from a user-specified filename, this keyword declares the use of a full matrix format, i.e., the user provides all values of the matrix, not just the diagonal. The matrix must be symmetric, positive-definite.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  matrix filename 'dakota_cantilever_queso.matrix.dat'
```

7.2.68.1.15 options_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [queso](#)
- [options_file](#)

File containing advanced QUESO options

Specification

Alias: none

Argument(s): STRING

Default: no advanced options file

Description

Allow power users to override default QUESO options such as hyper-parameter priors, initial chain position, and proposal covariance (including hyper-parameters), which might not be accessible through Dakota user input.

Default Behavior No advanced options used.

Usage Tips The `options_file` offers a final override over other options settings, which are applied with the following precedence:

1. QUESO library defaults
2. Dakota hard-coded defaults
3. Settings from Dakota input file
4. Settings from the advanced `options_file`

Examples

```
# FILE: dakota_queso.opts

# Base QUESO Environment options
env_subDisplayFileName = QuesoDiagnostics/display
env_subDisplayAllowedSet = 0 1
env_displayVerbosity = 2
env_seed = 2460
```

	Optional		seed	Seed of the random number generator
	Optional		rng	Selection of a random number generator
	Required		build_samples	Number of initial model evaluations used in build phase
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate
	Optional		standardized_space	Perform Bayesian inference in standardized probability space
	Optional		logit_transform	Utilize the logit transformation to reduce sample rejection for bounded domains

	Optional		gpmsa_normalize	Enable GPMSA-internal normalization
	Optional		export_chain_points_file	Export the MCMC chain to the specified filename
	Optional (<i>Choose One</i>)	MCMC Algorithm (Group 1)	dram	Use the DRAM MCMC algorithm
			delayed_rejection	Use the Delayed Rejection MCMC algorithm
			adaptive_metropolis	Use the Adaptive Metropolis MCMC algorithm
			metropolis_hastings	Use the Metropolis-Hastings MCMC algorithm
	Optional		proposal_covariance	Defines the technique used to generate the MCMC proposal covariance.
	Optional		options_file	File containing advanced QUESO/GPMSA options

Description

GPMSA (Gaussian Process Models for Simulation Analysis) is a surrogate-based Markov Chain Monte Carlo Bayesian calibration method. Dakota's GPMSA is an experimental capability and not ready for production use at this time.

Central to GPMSA is the construction of a Gaussian Process emulator from simulation runs collected at various settings of input parameters. The emulator is a statistical model of the system response, and it is used to incorporate the observational data to improve system predictions and constrain or calibrate the unknown parameters. The GPMSA code draws heavily on the theory developed in the seminal Bayesian calibration paper by Kennedy and O'Hagan [56]. The particular approach in GPMSA was developed by the Los Alamos National Laboratory statistics group and documented in [49]. Dakota's GPMSA capability comes from the QUESO package developed at UT Austin.

Usage Tips:

Configuring GPMSA essentially involves identifying the simulation build data, the experiment data, the calibration and configuration (state) variables, and any necessary algorithm controls. The GP surrogate model is automatically constructed internal to the algorithm and need not be specified through Dakota input.

Dakota's GPMSA implementation is not intended for production use. There are a number of known limitations, including:

- Only works for scalar and multivariate responses, not field responses. Field responses will be treated as a single multi-variate response set. Consequently, simulation and experiment data must have the same dimensions.

- When build data is not imported a design of experiments will be conducted over all calibration and scenario variables present.
- Experiment data is required (one cannot pose the simulation data as a set of residuals with the assumption of 0-valued experiments).
- Output and diagnostics are limited. Advanced users will need to examine QUESO output files (potentially written in a transformed scaled space) in the QuesoDiagnostic directory

Examples

The following input file fragment illustrates GPMSA-based Bayesian calibration of 3 β variables with a uniform prior, with 3 configuration (scenario) variables x . A total of 60 simulation build points are provided in `sim_data.dat`, which contains columns for each β , followed by each x , and then the simulation response 'lin'. Each row of the experiment data file `y_exp_with_var.dat` contains the values of the 3 x variables, followed by the value of 'lin' and its observation error (variance).

7.2.68.2.1 chain_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [chain_samples](#)

Number of Markov Chain Monte Carlo posterior samples

Specification

Alias: samples

Argument(s): INTEGER

Default: method-dependent

Description

The `chain_samples` keyword indicates the number of draws from the posterior distribution to perform. When an emulator is active, this will be the number of samples on the constructed surrogate model.

Default Behavior

The default number of chain samples is method-dependent. QUESO and MUQ methods use 1000. DREAM uses (number of generations) x (number of chains), resulting in `chain_samples` close to that specified.

Usage Tips

MCMC methods typically require a large number of chain samples to converge, often thousands to millions.

Examples

```
method
  bayes_calibration queso
  chain_samples = 20000
```

7.2.68.2.2 seed

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.68.2.3 rng

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [rng](#)

Selection of a random number generator

Specification

Alias: none

Argument(s): none

Default: Mersenne twister (`mt19937`)

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group RNG Algorithm (Group 1)	Dakota Keyword mt19937	Dakota Keyword Description Generates random numbers using the Mersenne twister
			rnum2	Generates pseudo-random numbers using the Pecos package

Description

The `rng` keyword is used to indicate a choice of random number generator.

Default Behavior

If specified, the `rng` keyword must be accompanied by either `rnum2` (pseudo-random numbers) or `mt19937` (random numbers generated by the Mersenne twister). Otherwise, `mt19937`, the Mersenne twister is used by default.

Usage Tips

The default is recommended, as the Mersenne twister is a higher quality random number generator.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.68.2.3.1 mt19937

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [rng](#)
- [mt19937](#)

Generates random numbers using the Mersenne twister

Specification

Alias: none

Argument(s): none

Description

The `mt19937` keyword directs Dakota to use the Mersenne twister to generate random numbers. Additional information can be found on wikipedia: http://en.wikipedia.org/wiki/Mersenne_twister.

Default Behavior

`mt19937` is the default random number generator. To specify it explicitly in the Dakota input file, however, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng mt19937
```

7.2.68.2.3.2 rnum2

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)

- [rng](#)
- [rnum2](#)

Generates pseudo-random numbers using the Pecos package

Specification

Alias: none

Argument(s): none

Description

The `rnum2` keyword directs Dakota to use pseudo-random numbers generated by the Pecos package.

Default Behavior

`rnum2` is not used by default. To change this behavior, it must be specified in conjunction with the `rng` keyword.

Usage Tips

Use of the Mersenne twister random number generator (`mt19937`) is recommended over `rnum2`.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 98765
    rng rnum2
```

7.2.68.2.4 build_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: none

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.68.2.5 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional Optional (<i>Choose One</i>)	Description of Group Tabular Format (Group 1)	Dakota Keyword custom_annotated	Dakota Keyword Description Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.2.5.1 custom_annotated

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file

	Optional	eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional	interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether header row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26          0.76
2              0.90009      1.1 0.0001996404857  0.2601620081  0.759955
3              0.89991      1.1 0.0002003604863  0.2598380081  0.760045
...
```

7.2.68.2.5.5 annotated

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002          0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.2.5.6 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009        1.1 0.0001996404857  0.2601620081  0.759955
0.89991        1.1 0.0002003604863  0.2598380081  0.760045
...

```

7.2.68.2.6 standardized_space

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [standardized_space](#)

Perform Bayesian inference in standardized probability space

Specification

Alias: none

Argument(s): none

Description

This option transforms the inference process (MCMC sampling and any emulator model management) into a standardized probability space.

The variable transformations performed are as described in [askey](#).

Default Behavior

The default for the Gaussian process and no emulator options is to perform inference in the original probability space (no transformation). Polynomial chaos and stochastic collocation emulators, on the other hand, are always formed in standardized probability space, such that the inference process is also performed in this standardized space.

Expected Output

The user will see the truth model evaluations performed in the original space, whereas any method diagnostics relating to the MCMC samples (e.g., QUESO data in the outputData directory) will report points and response data (response gradients and Hessians, if present, will differ but response values will not) that correspond to the transformed space.

Usage Tips

Selecting `standardized_space` generally has the effect of scaling the random variables to be of comparable magnitude, which can improve the efficiency of the Bayesian inference process.

Examples

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  dram
  standardized_space
```

7.2.68.2.7 logit_transform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [logit_transform](#)

Utilize the logit transformation to reduce sample rejection for bounded domains

Specification

Alias: none

Argument(s): none

Description

The logit transformation performs an internal variable transformation from bounded domains to unbounded domains in order to reduce sample rejection due to an out-of-bounds condition.

Default Behavior

This option is experimental at present, and is therefore defaulted off.

Usage Tips

This option can be helpful when regions of high posterior density exist in the corners of a multi-dimensional bounded domain. In these cases, it may be difficult to generate feasible samples from the proposal density, such that transformation to unbounded domains may greatly reduce sample rejection rates.

Examples

```
method,  
  bayes_calibration queso  
  samples = 2000 seed = 348  
  dram  
  logit_transform
```

7.2.68.2.8 gpmsa_normalize

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [gpmsa_normalize](#)

Enable GPMSA-internal normalization

Specification

Alias: none

Argument(s): none

Description

Normalize variables and data (surrogate model build and experiment) when constructing the underlying Gaussian Process emulator. When specified, this option will normalize calibration parameters and configuration (scenario) variables based on the min/max of the build data. It will normalize simulation and experiment data by the mean and variance of the simulation build data.

Default Behavior No GPMSA-specific scaling used.

Examples

```
method  
  bayes_calibration gpmsa  
  chain_samples 1000  
  seed 2460  
  ...  
  gpmsa_normalize
```

7.2.68.2.9 export_chain_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)

- [export_chain_points_file](#)

Export the MCMC chain to the specified filename

Specification

Alias: none

Argument(s): STRING

Default: chain export to default filename

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

Description

The filename to which the final MCMC posterior chain will be exported.

Default Behavior No export to file.

Expected Output

A tabular data file will be produced in the specified format (annotated by default) containing samples from the posterior distribution.

Usage Tips

Additional Discussion

7.2.68.2.9.1 [custom_annotated](#)

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [export_chain_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment

- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.2.10 dram

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [dram](#)

Use the DRAM MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

The type of Markov Chain Monte Carlo used. This keyword specifies the use of DRAM, (Delayed Rejection Adaptive Metropolis) [40].

Default Behavior

Five MCMC algorithm variants are supported: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Usage Tips

If the user knows very little about the proposal covariance, using `dram` is a recommended strategy. The proposal covariance is adaptively updated, and the delayed rejection may help improve low acceptance rates.

Examples

```
method,
  bayes_calibration queso
  dram
  samples = 10000 seed = 348
```

7.2.68.2.11 `delayed_rejection`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [delayed_rejection](#)

Use the Delayed Rejection MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

This keyword specifies the use of the Delayed Rejection algorithm in which there can be a delay in rejecting samples from the chain. That is, the "DR" part of DRAM is used but the "AM" part is not, rather a regular Metropolis-Hastings algorithm is used.

Default Behavior

Five MCMC algorithm variants are supported: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Usage Tips

If the user knows something about the proposal covariance or the proposal covariance is informed through derivative information, using `delayed_rejection` is preferred over `dram`: the proposal covariance is already being informed by derivative information and the adaptive metropolis is not necessary.

Examples

```
method,
  bayes_calibration queso
  delayed_rejection
  samples = 10000 seed = 348
```

See Also

These keywords may also be of interest:

- [proposal_covariance](#)

7.2.68.2.12 adaptive_metropolis

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [adaptive_metropolis](#)

Use the Adaptive Metropolis MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

This keyword specifies the use of the Adaptive Metropolis algorithm. That is, the "AM" part of DRAM is used but the "DR" part is not: specifying this keyword activates only the Adaptive Metropolis part of the MCMC algorithm, in which the covariance of the proposal density is updated adaptively.

Default Behavior

Five MCMC algorithm variants are supported in QUESO: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Four MCMC variants are currently supported in MUQ: `dram`, `delayed_rejection`, `metropolis_hastings` and `adaptive_metropolis`.

Usage Tips

If the user knows very little about the proposal covariance, but doesn't want to incur the cost of using full `dram` with both delayed rejection and adaptive metropolis, specifying only `adaptive_metropolis` offers a good strategy.

Examples

```
method,
  bayes_calibration queso
  adaptive_metropolis
  samples = 10000 seed = 348
```

7.2.68.2.13 metropolis_hastings

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [metropolis_hastings](#)

Use the Metropolis-Hastings MCMC algorithm

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Default: dram

Description

This keyword specifies the use of a Metropolis-Hastings algorithm for the MCMC chain generation. This means there is no delayed rejection and no adaptive proposal covariance updating as in DRAM.

Default Behavior

Five MCMC algorithm variants are supported currently in QUESO: `dram`, `delayed_rejection`, `adaptive_metropolis`, `metropolis_hastings`, and `multilevel`. The default is `dram`.

Four MCMC algorithm variants are currently supported in MUQ: `dram`, `delayed_rejection`, `metropolis_hastings` and `adaptive_metropolis`.

Usage Tips

If the user wants to use Metropolis-Hastings, possibly as a comparison to the other methods which involve more chain adaptation, this is the MCMC type to use.

Examples

```
method,
  bayes_calibration queso
  metropolis_hastings
  samples = 10000 seed = 348
```

7.2.68.2.14 proposal_covariance

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)

Defines the technique used to generate the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Proposal Covariance Source (Group 1)	prior	Uses the covariance of the prior distributions to define the MCMC proposal covariance.
			derivatives	Use derivatives to inform the MCMC proposal covariance.
			values	Specifies matrix values to use as the MCMC proposal covariance.
			filename	Uses a file to import a user-specified MCMC proposal covariance.

Description

The proposal covariance is used to define a multivariate normal (MVN) jumping distribution used to create new points within a Markov chain. That is, a new point in the chain is determined by sampling within a MVN probability density with prescribed covariance that is centered at the current chain point. The accuracy of the proposal covariance has a significant effect on rejection rates and the efficiency of chain mixing.

Default Behavior

The default proposal covariance is `prior` when no emulator is present; `derivatives` when an emulator is present.

Expected Output

The effect of the proposal covariance is reflected in the MCMC chain values and the rejection rates, which can be seen in the diagnostic outputs from the QUESO solver within the `QuesoDiagnostics` directory.

Usage Tips

When derivative information is available inexpensively (e.g., from an emulator model), the derived-based proposal covariance forms a more accurate proposal distribution, resulting in lower rejection rates and faster chain mixing.

7.2.68.2.14.1 `prior`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [prior](#)

Uses the covariance of the prior distributions to define the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		multiplier	Multiplier to scale prior variance

Description

This keyword selection results in definition of the MCMC proposal covariance from the covariance of the prior distributions. This covariance is currently assumed to be diagonal without correlation.

Default Behavior

This is the default `proposal_covariance` option.

Usage Tips

Since this proposal covariance is defined globally, the chain does not need to be periodically restarted using local updates to this proposal. However, it is usually effective to adapt the proposal using one of the adaptive metropolis MCMC options.

Examples

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  dram
  proposal_covariance prior
```

7.2.68.2.14.2 multiplier

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [prior](#)
- [multiplier](#)

Multiplier to scale prior variance

Specification

Alias: none

Argument(s): REAL

Default: 1.0

Description

The initial proposal covariance will be given by the prior variance times the multiplier.

Default Behavior When using prior-based proposal covariance, the default is to use the prior variance for the proposal (multiplier = 1.0)

Usage Tips

The prior variance may result in too tight or narrow a proposal covariance. The multiplier can be used to scale all entries of the prior variance in determining the initial proposal covariance.

Examples

```
method
  bayes_calibration queso
    samples = 2000 seed = 348
  dram
    proposal_covariance prior
    multiplier 0.1
```

7.2.68.2.14.3 derivatives

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [derivatives](#)

Use derivatives to inform the MCMC proposal covariance.

Topics

This keyword is related to the topics:

- [bayesian_calibration](#)

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		update_period	Period at which to update derivative-based proposal covariance

Description

This keyword selection results in definition of the MCMC proposal covariance from the Hessian of the misfit function (negative log likelihood), where this Hessian is defined from either a Gauss-Newton approximation (using only first derivatives of the calibration terms) or a full Hessian (using values, first derivatives, and second derivatives of the calibration terms). If this Hessian is indeterminate, it will be corrected as described in [16]

Default Behavior The default is `prior` based proposal covariance. This is a more advanced option that exploits structure in the form of the likelihood.

Expected Output

When derivatives are specified for defining the proposal covariance, the misfit Hessian and its inverse (the MVN proposal covariance) will be output to the standard output stream.

Usage Tips

The full Hessian of the misfit is used when either supported by the emulator in use (for PCE and surpack GP, but not SC or dakota GP) or by the user's response specification (Hessian type is not "no_hessians"), in the case of no emulator. When this full Hessian is indefinite and cannot be inverted to form the proposal covariance, fallback to the positive semi-definite Gauss-Newton Hessian is employed.

Since this proposal covariance is locally accurate, it should be updated periodically using the `update_period` option. While the adaptive metropolis option can be used in combination with derivative-based preconditioning, it is generally preferable to instead decrease the proposal update period due to the improved local accuracy of this approach.

Examples

Generate a 2000 sample posterior chain, using derivatives to initialize the proposal covariance at the start of the chain.

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  delayed_rejection
  emulator pce sparse_grid_level = 2
  proposal_covariance derivatives
```

7.2.68.2.14.4 update_period

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [derivatives](#)
- [update_period](#)

Period at which to update derivative-based proposal covariance

Specification

Alias: none

Argument(s): INTEGER

Description

For derivative-based proposal covariance, this specifies the period (number of accepted MCMC samples) after which the proposal covariance is updated using derivative values at the current chain point.

Default Behavior

When `update_period` is not specified, derivatives will inform the proposal covariance at the start of the chain, but not updated further.

Usage Tips

The `update_period` should be tailored to the size of the total chain, accounting for the relative expense of derivative-based proposal updates.

Examples

```
method,
  bayes_calibration queso
  samples = 2000 seed = 348
  delayed_rejection
  emulator pce sparse_grid_level = 2
  proposal_covariance derivatives
  update_period = 40 # update proposal covariance every 40 points
```

7.2.68.2.14.5 values

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [values](#)

Specifies matrix values to use as the MCMC proposal covariance.

Specification

Alias: none

Argument(s): REALLIST

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Values For (Group 1)	Dakota Keyword diagonal	Dakota Keyword Description Specifies the diagonal matrix format when specifying a user-specified proposal covariance.
			matrix	Specifies the full matrix format when specifying a user-specified proposal covariance.

Description

This keyword selection results in definition of the MCMC proposal covariance from user-specified matrix values. The matrix input format must be declared as either a full matrix or a matrix diagonal.

Default Behavior

This option is not the default, and generally implies special a priori knowledge from the user.

Usage Tips

This option is not supported for the case of transformations to standardized probability space.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  values ... # See leaf nodes for required format option
```

7.2.68.2.14.6 diagonal

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [values](#)
- [diagonal](#)

Specifies the diagonal matrix format when specifying a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When specifying the MCMC proposal covariance in an input file, this keyword declares the use of a diagonal matrix format, i.e., the user only provides the (positive) values along the diagonal.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
    diagonal values 1.0e6 1.0e-1
```

7.2.68.2.14.7 matrix

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [values](#)
- [matrix](#)

Specifies the full matrix format when specifying a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When specifying the MCMC proposal covariance in an input file, this keyword declares the use of a full matrix format, i.e., the user provides all values of the matrix, not just the diagonal. The matrix must be symmetric, positive-definite.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
    matrix values 1.0 0.1
                 0.1 2.0
```

7.2.68.2.14.8 filename

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)

- [gpmsa](#)
- [proposal_covariance](#)
- [filename](#)

Uses a file to import a user-specified MCMC proposal covariance.

Specification

Alias: none

Argument(s): STRING

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Values For (Group 1)	Dakota Keyword diagonal	Dakota Keyword Description Specifies the diagonal matrix format when importing a user-specified proposal covariance.
			matrix	Specifies the full matrix format when importing a user-specified proposal covariance.

Description

This keyword selection results in definition of the MCMC proposal covariance from importing data a user-specified filename. This import must be declared as either a full matrix or a matrix diagonal.

Default Behavior

This option is not the default, and generally implies special a priori knowledge from the user.

Usage Tips

This option is not supported for the case of transformations to standardized probability space.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  filename ... # See leaf nodes for required format option
```

- [Keywords Area](#)
- [method](#)

- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [filename](#)
- [diagonal](#)

Specifies the diagonal matrix format when importing a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When importing the MCMC proposal covariance from a user-specified filename, this keyword declares the use of a diagonal matrix format, i.e., the user only provides the (positive) values along the diagonal.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  diagonal filename 'dakota_cantilever_queso.diag.dat'
```

7.2.68.2.14.10 matrix

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [proposal_covariance](#)
- [filename](#)
- [matrix](#)

Specifies the full matrix format when importing a user-specified proposal covariance.

Specification

Alias: none

Argument(s): none

Description

When importing the MCMC proposal covariance from a user-specified filename, this keyword declares the use of a full matrix format, i.e., the user provides all values of the matrix, not just the diagonal. The matrix must be symmetric, positive-definite.

Examples

```
method,
  bayes_calibration queso
  samples = 1000 seed = 348
  dram
  proposal_covariance
  matrix filename 'dakota_cantilever_queso.matrix.dat'
```

7.2.68.2.15 options_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [gpmsa](#)
- [options_file](#)

File containing advanced QUESO/GPMSA options

Specification

Alias: none

Argument(s): STRING

Default: no advanced options file

Description

Allow power users to override default QUESO/GPMSA options such as hyper-parameter priors, initial chain position, and proposal covariance (including hyper-parameters), which might not be accessible through Dakota user input.

Default Behavior No advanced options used.

Usage Tips The `options_file` offers a final override over other options settings, which are applied with the following precedence:

1. QUESO library defaults
2. Dakota hard-coded defaults
3. Settings from Dakota input file
4. Settings from the advanced `options_file`

Examples

```
# FILE: dakota_gpmsa.opts

# Base QUESO Environment options
env_subDisplayFileName = QuesoDiagnostics/display
env_subDisplayAllowedSet = 0 1
env_displayVerbosity = 2
env_seed = 2460

# GPMSA Options
gpmsa_emulator_precision_shape = 2.0
gpmsa_emulator_precision_scale = 0.2
gpmsa_emulator_correlation_strength_alpha = 1.0
```

```
gpmsa_emulator_correlation_strength_beta = 0.1
gpmsa_discrepancy_precision_shape = 1.0
gpmsa_discrepancy_precision_scale = 1e4
gpmsa_discrepancy_correlation_strength_alpha = 1.0
gpmsa_discrepancy_correlation_strength_beta = 0.1
gpmsa_emulator_data_precision_shape = 3.0
gpmsa_emulator_data_precision_scale = 333.333
```

7.2.68.3 wasabi

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)

(Experimental Method) Non-MCMC Bayesian inference using interval analysis

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		pushforward_ - samples	(Experimental Capability) Number of samples of the prior to push forward through the model Description: WASABI requires a forward UQ that maps samples from the prior parameter distribution through the model. The corresponding responses then are used to see their relative likelihood according to the density of the observational data. The pushforward_ - samples refers to the number of samples taken from the prior and used in the forward UQ. It typically should be high, e.g. 10000, of which only a small fraction may be in a high density region of the posterior.
	Optional		seed	Seed of the random number generator
	Optional		emulator	Use an emulator or surrogate model to evaluate the likelihood function
	Optional		standardized_ - space	Perform Bayesian inference in standardized probability space

	<p>Required</p> <p>Optional</p>	<p><code>data_distribution</code></p> <p><code>posterior_samples_ - _import_filename</code></p>	<p>(Experimental Capability) Specify the distribution of the experimental data</p> <p>(Experimental Capability) Filename for samples at which the user would like the posterior density calculated</p>
	<p>Optional</p>	<p><code>generate_ - posterior_samples</code></p>	<p>(Experimental Capability) Generate random samples from the posterior density</p> <p>Description: This keyword will result in samples from the prior that have a high posterior density being printed to a file called 'psamples.txt' as a default, or to a file specified by the <code>posterior_ - samples_ - export_ - filename</code>.</p>

	Optional	evaluate_posterior_density	(Experimental Capability) Evaluate the posterior density and output to the specified file Description: This keyword will allow the evaluation of the posterior density for all of the prior samples, typically specified with the number given in <code>pushforward_samples</code> . The density will be printed either to a file named 'pdens.txt' as a default, or to the file specified in <code>posterior_density_export_filename</code> .
--	-----------------	--	--

Description

Offers an alternative to Markov Chain Monte Carlo-based Bayesian inference. This is a nascent capability, not yet ready for production use.

Usage Guidelines: The WASABI method requires an emulator model.

Attention: While the `emulator` specification for WASABI includes the keyword `posterior_adaptive`, it is not yet operational.

Examples

```
method
  bayes_calibration
  wasabi
```

7.2.68.3.1 pushforward_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [pushforward_samples](#)

(Experimental Capability) Number of samples of the prior to push forward through the model

Description: WASABI requires a forward UQ that maps samples from the prior parameter distribution through the model. The corresponding responses then are used to see their relative likelihood according to the density of the

observational data. The `pushforward_samples` refers to the number of samples taken from the prior and used in the forward UQ. It typically should be high, e.g. 10000, of which only a small fraction may be in a high density region of the posterior.

Specification

Alias: none

Argument(s): INTEGER

Default: method-dependent

7.2.68.3.2 `seed`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [seed](#)

Seed of the random number generator

Specification

Alias: none

Argument(s): INTEGER

Default: system-generated (non-repeatable)

Description

The random `seed` control provides a mechanism for making a stochastic method repeatable. That is, the use of the same random seed in identical studies will generate identical results.

Default Behavior

If not specified, the seed is randomly generated.

Expected Output

If `seed` is specified, a stochastic study will generate identical results when repeated using the same seed value. Otherwise, results are not guaranteed to be the same.

Usage Tips

If a stochastic study was run without `seed` specified, and the user later wishes to repeat the study using the same seed, the value of the seed used in the original study can be found in the output Dakota prints to the screen. That value can then be added to the Dakota input file.

Examples

```
method
  sampling
    sample_type lhs
    samples = 10
    seed = 15347
```

7.2.68.3.3 emulator

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)

Use an emulator or surrogate model to evaluate the likelihood function

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Emulator Type (Group 1)	gaussian_process	Gaussian Process surrogate model
			pce	Polynomial Chaos Expansion surrogate model
			ml_pce	Multilevel Polynomial Chaos Expansion as an emulator model.
			mf_pce	Multifidelity Polynomial Chaos Expansion as an emulator model.
			sc	Stochastic Collocation as an emulator model.
			mf_sc	Multifidelity Stochastic Collocation as an emulator model.

Description

This keyword describes the type of emulator used when calculating the likelihood function for the Bayesian calibration. The emulator can be a Gaussian process, polynomial chaos expansion, or stochastic collocation.

7.2.68.3.3.1 gaussian_process

- [Keywords Area](#)

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)

Gaussian Process surrogate model

Specification

Alias: kriging

Argument(s): none

Default: Surfpack Gaussian process

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group GP Implementation (Group 1)	Dakota Keyword surfpack	Dakota Keyword Description Use the Surfpack version of Gaussian Process surrogates
			dakota	Select the built in Gaussian Process surrogate
	Optional		build_samples	Number of initial model evaluations used in build phase
	Optional		posterior_adaptive	Adapt emulator model to increase accuracy in high posterior probability regions
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Use the Gaussian process (GP) surrogate from Surfpack, which is specified using the [surfpack](#) keyword.

An alternate version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the `dakota` version is deprecated and intended to be removed in a future release.**

Known Issue: When using discrete variables, there have been sometimes significant differences in surrogate behavior observed across computing platforms in some cases. The cause has not yet been fully diagnosed and is currently under investigation. In addition, guidance on appropriate construction and use of surrogates with discrete variables is under development. In the meantime, users should therefore be aware that there is a risk of inaccurate results when using surrogates with discrete variables.

7.2.68.3.3.2 surfpack

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)
- [surfpack](#)

Use the Surfpack version of Gaussian Process surrogates

Specification

Alias: none

Argument(s): none

Description

This keyword specifies the use of the Gaussian process that is incorporated in our surface fitting library called Surfpack.

Several user options are available:

1. Optimization methods:

Maximum Likelihood Estimation (MLE) is used to find the optimal values of the hyper-parameters governing the trend and correlation functions. By default the global optimization method DIRECT is used for MLE, but other options for the optimization method are available. See [optimization_method](#).

The total number of evaluations of the likelihood function can be controlled using the `max_trials` keyword followed by a positive integer. Note that the likelihood function does not require running the "truth" model, and is relatively inexpensive to compute.

2. Trend Function:

The GP models incorporate a parametric trend function whose purpose is to capture large-scale variations. See [trend](#).

3. Correlation Lengths:

Correlation lengths are usually optimized by Surfpack, however, the user can specify the lengths manually. See [correlation_lengths](#).

4. Ill-conditioning

One of the major problems in determining the governing values for a Gaussian process or Kriging model is the fact that the correlation matrix can easily become ill-conditioned when there are too many input points close together. Since the predictions from the Gaussian process model involve inverting the correlation matrix, ill-conditioning can lead to poor predictive capability and should be avoided.

Note that a sufficiently bad sample design could require correlation lengths to be so short that any interpolatory GP model would become inept at extrapolation and interpolation.

The `surfpack` model handles ill-conditioning internally by default, but behavior can be modified using

5. Gradient Enhanced Kriging (GEK).

The `use_derivatives` keyword will cause the Surfpack GP to be constructed from a combination of function value and gradient information (if available).

See notes in the Theory section.

Theory

Gradient Enhanced Kriging

Incorporating gradient information will only be beneficial if accurate and inexpensive derivative information is available, and the derivatives are not infinite or nearly so. Here "inexpensive" means that the cost of evaluating a function value plus gradient is comparable to the cost of evaluating only the function value, for example gradients computed by analytical, automatic differentiation, or continuous adjoint techniques. It is not cost effective to use derivatives computed by finite differences. In tests, GEK models built from finite difference derivatives were also significantly less accurate than those built from analytical derivatives. Note that GEK's correlation matrix tends to have a significantly worse condition number than Kriging for the same sample design.

This issue was addressed by using a pivoted Cholesky factorization of Kriging's correlation matrix (which is a small sub-matrix within GEK's correlation matrix) to rank points by how much unique information they contain. This reordering is then applied to whole points (the function value at a point immediately followed by gradient information at the same point) in GEK's correlation matrix. A standard non-pivoted Cholesky is then applied to the reordered GEK correlation matrix and a bisection search is used to find the last equation that meets the constraint on the (estimate of) condition number. The cost of performing pivoted Cholesky on Kriging's correlation matrix is usually negligible compared to the cost of the non-pivoted Cholesky factorization of GEK's correlation matrix. In tests, it also resulted in more accurate GEK models than when pivoted Cholesky or whole-point-block pivoted Cholesky was performed on GEK's correlation matrix.

- [dakota](#)

Select the built in Gaussian Process surrogate

Specification

Alias: none

Argument(s): none

Description

A second version of GP surrogates was available in prior versions of Dakota. **For now, both versions are supported but the dakota version is deprecated and intended to be removed in a future release.**

Historically these models were drastically different, but in Dakota 5.1, they became quite similar. They now differ in that the Surfpack GP has a richer set of features/options and tends to be more accurate than the Dakota version. Due to how the Surfpack GP handles ill-conditioned correlation matrices (which significantly contributes to its greater accuracy), the Surfpack GP can be a factor of two or three slower than Dakota's. As of Dakota 5.2, the Surfpack implementation is the default in all contexts except Bayesian calibration.

More details on the `gaussian_process` dakota model can be found in [60].

Dakota's GP deals with ill-conditioning in two ways. First, when it encounters a non-invertible correlation matrix it iteratively increases the size of a "nugget," but in such cases the resulting approximation smooths rather than interpolates the data. Second, it has a `point_selection` option (default off) that uses a greedy algorithm to

select a well-spaced subset of points prior to the construction of the GP. In this case, the GP will only interpolate the selected subset. Typically, one should not need point selection in trust-region methods because a small number of points are used to develop a surrogate within each trust region. Point selection is most beneficial when constructing with a large number of points, typically more than order one hundred, though this depends on the number of variables and spacing of the sample points.

This differs from the `point_selection` option of the Dakota GP which initially chooses a well-spaced subset of points and finds the correlation parameters that are most likely for that one subset.

7.2.68.3.3.4 `build_samples`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)
- [build_samples](#)

Number of initial model evaluations used in build phase

Specification

Alias: none

Argument(s): INTEGER

Description

The number of build points or training points used in the initial phase of an algorithm or model construction. Typically these are the initial set of data points used to construct (train) a surrogate model (emulator). If the number of `build_samples` is less than the minimum number of points required to build the surrogate, Dakota will augment the samples to obtain the minimum required.

Examples

Perform GP-based adaptive importance sampling, building the GP with 100 points and then performing 100 approximate evaluations to evaluate the probability.

```
method
  gpais
    build_samples = 100
    samples_on_emulator = 100
    max_iterations = 5
    response_levels = -1.065
```

7.2.68.3.3.5 `posterior_adaptive`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)

- [emulator](#)
- [gaussian_process](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```
bayes_calibration queso
  chain_samples = 2000 seed = 348
  delayed_rejection
  emulator
    gaussian_process surfpack build_samples = 30
    posterior_adaptive max_iterations = 10
    proposal_covariance derivatives
```

7.2.68.3.3.6 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.3.3.7 custom_annotated

- [Keywords Area](#)
- [method](#)

- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)

- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and eval_id (no interface_id), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002          0.26           0.76

- [gaussian_process](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated_header eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002         0.26         0.76

```

7.2.68.3.3.12 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009         1.1 0.0001996404857 0.2601620081 0.759955
0.89991         1.1 0.0002003604863 0.2598380081 0.760045

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [gaussian_process](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Dimension Adaptivity Estimation Approach (Group 1)	sobol	Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.
			decay	Estimate spectral coefficient decay rates to guide dimension-adaptive refinement.

			generalized	Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.
--	--	--	-----------------------------	---

Description

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to hold higher 'importance' in resolving statistical quantities of interest.

Dimension importance must be estimated as part of the refinement process. Techniques include either sobol or generalized for stochastic collocation and either sobol, decay, or generalized for polynomial chaos. Each of these automated refinement approaches makes use of the max_iterations and convergence_tolerance iteration controls.

- [wasabi](#)
- [emulator](#)
- [pce](#)
- [quadrature_order](#)

Order for tensor-products of Gaussian quadrature rules

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		dimension_preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional (<i>Choose One</i>)	Quadrature Rule Nesting (Group 1)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multidimensional integration by a tensor-product of Gaussian quadrature rules (specified with `quadrature_order`, and, optionally, `dimension_preference`). The default rule selection is to employ `non_nested` Gauss rules including Gauss-Hermite (for normals or transformed normals), Gauss-Legendre (for uniforms or transformed uniforms), Gauss-Jacobi (for betas), Gauss-Laguerre (for exponentials), generalized Gauss-Laguerre (for

gammas), and numerically-generated Gauss rules (for other distributions when using an Extended basis). For the case of `p_refinement` or the case of an explicit `nested` override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse. By specifying a `dimension_preference`, where higher preference leads to higher order polynomial resolution, the tensor grid may be rendered anisotropic. The dimension specified to have highest preference will be set to the specified `quadrature_order` and all other dimensions will be reduced in proportion to their reduced preference; any non-integral portion is truncated. To synchronize with tensor-product integration, a tensor-product expansion is used, where the order p_i of the expansion in each dimension is selected to be half of the integrand precision available from the rule in use, rounded down. In the case of non-nested Gauss rules with integrand precision $2m_i - 1$, p_i is one less than the quadrature order m_i in each dimension (a one-dimensional expansion contains the same number of terms, $p + 1$, as the number of Gauss points). The total number of terms, N , in a tensor-product expansion involving n uncertain input variables is

$$N = 1 + P = \prod_{i=1}^n (p_i + 1)$$

In some advanced use cases (e.g., multifidelity UQ), multiple grid resolutions can be employed; for this reason, the `quadrature_order` specification supports an array input.

A corresponding sequence specification is documented at, e.g., [quadrature_order_sequence](#) and [quadrature_order_sequence](#)

	Optional (Choose One)	Quadrature Rule Nesting (Group 2)	nested	Enforce use of nested quadrature rules if available
			non_nested	Enforce use of non-nested quadrature rules

Description

Multi-dimensional integration by the Smolyak sparse grid method (specified with `sparse_grid_level` and, optionally, `dimension_preference`). The underlying one-dimensional integration rules are the same as for the tensor-product quadrature case; however, the default rule selection is nested for sparse grids (Genz-Keister for normals/transformed normals and Gauss-Patterson for uniforms/transformed uniforms). This default can be overridden with an explicit `non_nested` specification (resulting in Gauss-Hermite for normals/transformed normals and Gauss-Legendre for uniforms/transformed uniforms). As for tensor quadrature, the `dimension_preference` specification enables the use of anisotropic sparse grids (refer to the PCE description in the User's Manual for the anisotropic index set constraint definition). Similar to anisotropic tensor grids, the dimension with greatest preference will have resolution at the full `sparse_grid_level` and all other dimension resolutions will be reduced in proportion to their reduced preference. For PCE with either isotropic or anisotropic sparse grids, a summation of tensor-product expansions is used, where each anisotropic tensor-product quadrature rule underlying the sparse grid construction results in its own anisotropic tensor-product expansion as described in case 1. These anisotropic tensor-product expansions are summed into a sparse PCE using the standard Smolyak summation (again, refer to the User's Manual for additional details). As for `quadrature_order`, the `sparse_grid_level` specification admits an array input for enabling specification of multiple grid resolutions used by certain advanced solution methodologies.

A corresponding sequence specification is documented at, e.g., [sparse_grid_level_sequence](#) and [sparse_grid_level_sequence](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the unrestricted keyword can be used; it

cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

Cubature using Stroud rules and their extensions

Specification

Alias: none

Argument(s): INTEGER

Description

Multi-dimensional integration by Stroud cubature rules [80] and extensions [94], as specified with `cubature_integrand`. A total-order expansion is used, where the isotropic order p of the expansion is half of the integrand order, rounded down. The total number of terms N for an isotropic total-order expansion of order p over n variables is given by

$$N = 1 + P = 1 + \sum_{s=1}^p \frac{1}{s!} \prod_{r=0}^{s-1} (n+r) = \frac{(n+p)!}{n!p!}$$

Since the maximum integrand order is currently five for normal and uniform and two for all other types, at most second- and first-order expansions, respectively, will be used. As a result, cubature is primarily useful for global sensitivity analysis, where the Sobol' indices will provide main effects and, at most, two-way interactions. In addition, the random variable set must be independent and identically distributed (*iid*), so the use of `askey` or `wiener` transformations may be required to create *iid* variable sets in the transformed space (as well as to allow usage of the higher order cubature rules for normal and uniform). Note that global sensitivity analysis often assumes uniform bounded regions, rather than precise probability distributions, so the *iid* restriction would not be problematic in that case.

The (initial) order of a polynomial expansion

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional		dimension_ - preference	A set of weights specifying the relative importance of each uncertain variable (dimension)
	Optional		basis_type	Specify the type of basis truncation to be used for a Polynomial Chaos Expansion.
	Required (Choose One)	Group 1	collocation_points	Number of collocation points used to estimate expansion coefficients
			collocation_ratio	Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.
			expansion_ - samples	Number of simulation samples used to estimate the expected value of a set of PCE coefficients
	Optional		import_build_ - points_file	File containing points you wish to use to build a surrogate
	Optional		posterior_adaptive	Adapt emulator model to increase accuracy in high posterior probability regions

Description

When the `expansion_order` for a polynomial chaos expansion is specified, the coefficients may be computed by integration based on random samples or by regression using either random or sub-sampled tensor product quadrature points.

Multidimensional integration by Latin hypercube sampling (specified with `expansion_samples`). In this case, the expansion order p cannot be inferred from the numerical integration specification and it is necessary to provide an `expansion_order` to specify p for a total-order expansion.

Linear regression (specified with either `collocation_points` or `collocation_ratio`). A total-order expansion is used and must be specified using `expansion_order` as described in the previous option. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear

relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$). When admissible, a constrained least squares approach is employed in which response values are first reproduced exactly and error in reproducing response derivatives is minimized. Two collocation grid options are supported: the default is Latin hypercube sampling ("point collocation"), and an alternate approach of "probabilistic collocation" is also available through inclusion of the `tensor_grid` keyword. In this alternate case, the collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

If `collocation_points` or `collocation_ratio` is specified, the PCE coefficients will be determined by regression. If no regression specification is provided, appropriate defaults are defined. Specifically SVD-based least-squares will be used for solving over-determined systems and under-determined systems will be solved using LASSO. For the situation when the number of function values is smaller than the number of terms in a PCE, but the total number of samples including gradient values is greater than the number of terms, the resulting over-determined system will be solved using equality constrained least squares. Technical information on the various methods listed below can be found in the Linear regression section of the Theory Manual. Some of the regression methods (OMP, LASSO, and LARS) are able to produce a set of possible PCE coefficient vectors (see the Linear regression section in the Theory Manual). If cross validation is inactive, then only one solution, consistent with the `noise_tolerance`, will be returned. If cross validation is active, Dakota will choose between possible coefficient vectors found internally by the regression method across the set of expansion orders (1,...,`expansion_order`) and the set of specified noise tolerances and return the one with the lowest cross validation error indicator.

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.68.3.3.55 cross_validation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.68.3.3.56 [noise_only](#)

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.3.3.57 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.3.3.58 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces samples = 2N). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.3.3.59 response_scaling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to [0,1] based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

See Also

These keywords may also be of interest:

- [multifidelity_polynomial_chaos](#)
- [multifidelity_function_train](#)

7.2.68.3.3.60 use_derivatives

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, it's use with Surfpack Gaussian process is not recommended.

7.2.68.3.3.61 tensor_grid

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.3.3.62 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_points](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.63 max_solver_iterations

- [collocation_points](#)
- [max_solver_iterations](#)

Maximum iterations in determining polynomial coefficients

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

When using an iterative polynomial coefficient estimation approach, e.g., cross-validation-based solvers, limits the maximum iterations in the coefficient solver.

7.2.68.3.3.64 collocation_ratio

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)

- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.

Specification

Alias: none

Argument(s): REAL

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Regression Algorithm (Group 1)	least_squares	Compute the coefficients of a polynomial expansion using least squares
			orthogonal_matching_pursuit	Compute the coefficients of a polynomial expansion using orthogonal matching pursuit (OMP)
			basis_pursuit	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit ℓ_1 -minimization problem using linear programming.
			basis_pursuit_denoising	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit Denoising ℓ_1 -minimization problem using second order cone optimization.

		least_angle_regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
		least_absolute_shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.
	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.
	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

	Optional	max_solver_ - iterations	Maximum iterations in determining polynomial coefficients
--	-----------------	--	---

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p, the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2.` produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

7.2.68.3.3.65 least_squares

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [least_squares](#)

Compute the coefficients of a polynomial expansion using least squares

Specification

Alias: none

Argument(s): none

Default: svd

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	LSQ Regression Approach (Group 1)	svd	Calculate the coefficients of a polynomial chaos expansion using the singular value decomposition.

			equality_-constrained	Calculate the coefficients of a polynomial chaos expansion using equality constrained least squares.
--	--	--	---------------------------------------	--

Description

Compute the coefficients of a polynomial expansion using least squares. Specifically SVD-based least-squares will be used for solving over-determined systems. For the situation when the number of function values is smaller than the number of terms in a PCE, but the total number of samples including gradient values is greater than the number of terms, the resulting over-determined system will be solved using equality constrained least squares

7.2.68.3.3.66 `svd`

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.68.3.3.84 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.3.3.85 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.86 max_solver_iterations

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [collocation_ratio](#)
- [max_solver_iterations](#)

Maximum iterations in determining polynomial coefficients

Specification

Alias: none

Argument(s): INTEGER

Default: 100

Description

When using an iterative polynomial coefficient estimation approach, e.g., cross-validation-based solvers, limits the maximum iterations in the coefficient solver.

7.2.68.3.3.87 expansion_samples

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [expansion_samples](#)

Number of simulation samples used to estimate the expected value of a set of PCE coefficients

Specification

Alias: none

Argument(s): INTEGER

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Description

In this case, the expansion order p cannot be inferred from the numerical integration specification and it is necessary to provide an `expansion_order` to specify p for a total-order expansion.

A corresponding sequence specification is documented at, e.g., [expansion_samples_sequence](#) and [expansion_samples_sequence](#)

- [expansion_samples](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.89 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.3.3.90 custom_annotated

- [Keywords Area](#)
- [method](#)

- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to annotated format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2      obj_fn nln_ineq_con_1 nln_ineq_con_2
1             0.9          1.1      0.0002      0.26          0.76
2             0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3             0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.94 `annotated`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002      0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.95 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.96 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)

- [expansion_order](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.3.3.97 `posterior_adaptive`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [expansion_order](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```
bayes_calibration queso
  chain_samples = 2000 seed = 348
  delayed_rejection
  emulator
    gaussian_process surfpack build_samples = 30
    posterior_adaptive max_iterations = 10
    proposal_covariance derivatives
```

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.3.3.101 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.102 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format

	Optional	active_only	Import only active variables from tabular data file
--	-----------------	-----------------------------	---

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID           0.9          1.1          0.0002          0.26          0.76
2          NO_ID           0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID           0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.108 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```
      0.9      1.1      0.0002      0.26      0.76
0.90009      1.1 0.0001996404857 0.2601620081 0.759955
0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.109 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.3.3.110 posterior_adaptive

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [orthogonal_least_interpolation](#)
- [posterior_adaptive](#)

Adapt emulator model to increase accuracy in high posterior probability regions

Specification

Alias: none

Argument(s): none

Description

Following an emulator-based MCMC process, this option refines the emulator by selecting points in regions of high posterior probability, performing truth evaluations at these points, updating the emulator, and reperforming the MCMC process. The adaptation is continued until the maximum number of iterations is exceeded or the convergence tolerance is met.

Examples

```
bayes_calibration queso
  chain_samples = 2000 seed = 348
  delayed_rejection
  emulator
    gaussian_process surfpack build_samples = 30
    posterior_adaptive max_iterations = 10
    proposal_covariance derivatives
```

7.2.68.3.3.111 askey

- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [pce](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

Sample allocation approach for multilevel expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Multilevel Sample Allocation Control (Group 1)	Dakota Keyword estimator_variance	Dakota Keyword Description Variance of mean estimator within multilevel polynomial chaos
			rip_sampling	Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Description

Multilevel expansions, including regression-based polynomial chaos expansion (PCE) and function train (FT) expansions, require a sample allocation strategy. Three options are currently available:

- allocation based on assuming a convergence rate for the estimator variance (for regression PCE)
- restricted isometry property (RIP) sampling (for regression PCE via compressed sensing)
- rank sampling (for FT)

Default Behavior

Current defaults, when `allocation_control` is not specified, are estimator variance for PCE and rank sampling for FT.

7.2.68.3.3.119 `estimator_variance`

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)

- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [estimator_variance](#)

Variance of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		estimator_rate	Rate of convergence of mean estimator within multilevel polynomial chaos

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ , with default values that may be overridden as part of this specification block.

This approach is supported for regression-based PCE approaches (over-determined least squares, under-determined compressed sensing, or orthogonal least interpolation).

In practice, it can be challenging to estimate a smooth convergence rate for estimator variance in the presence of abrupt transitions in the quality of sparse recoveries. As a result, sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the convergence of the estimator variance, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```

method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
  orthogonal_matching_pursuit
  expansion_order_sequence = 2
  pilot_samples = 10
  collocation_ratio = .9
  allocation_control
  estimator_variance estimator_rate = 2.5
  seed = 1237
  convergence_tolerance = .01

```

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [estimator_variance](#)
- [estimator_rate](#)

Rate of convergence of mean estimator within multilevel polynomial chaos

Specification

Alias: none

Argument(s): REAL

Default: 2

Description

Multilevel Monte Carlo performs optimal resource allocation based on a known estimator variance for the mean statistic:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{N}$$

Replacing the simple ensemble average estimator in Monte Carlo with a polynomial chaos estimator results in a different and unknown relationship between the estimator variance and the number of samples. In one approach to multilevel PCE, we can employ a parameterized estimator variance:

$$\text{Var}[\hat{Q}] = \frac{\sigma_Q^2}{\gamma N^\kappa}$$

for free parameters γ and κ .

The default values are $\gamma = 1$ and $\kappa = 2$ (adopts a more aggressive sample profile by assuming a faster convergence rate than Monte Carlo). This advanced specification option allows to user to specify κ , overriding the default.

7.2.68.3.3.121 rip_sampling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [allocation_control](#)
- [rip_sampling](#)

Sample allocation based on restricted isometry property (RIP) within multilevel polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multilevel polynomial chaos with compressed sensing may allocate the number of samples per level based on the restricted isometry property (RIP), applied to recovery at level l :

$$N_l \geq s_l \log^3(s_l) L_l \log(C_l)$$

for sparsity s , cardinality C , and mutual coherence L . The adaptive algorithm starts from a pilot sample, shapes the profile based on observed sparsity, and iterates until convergence. In practice, RIP sampling levels are quite conservative, and a collocation ratio constraint ($N_l \leq rC_l$, where r defaults to 2) must be enforced on the profile.

The algorithm relies on observed sparsity, it is appropriate for use with regularized solvers for compressed sensing. It employs orthogonal matching pursuit (OMP) by default and automatically activates cross-validation in order to choose the best noise parameter value for the recovery.

This capability is **experimental**. Sample allocation by greedy refinement is generally preferred.

Examples

This example starts with sparse recovery for a second-order candidate expansion at each level. As the number of samples is adapted for each level, as dictated by the number of sparse coefficient sets recovered for each level, the candidate expansion order is incremented as needed in order to synchronize with the specified collocation ratio.

```
method,
  model_pointer = 'HIERARCH'
  multilevel_polynomial_chaos
    orthogonal_matching_pursuit
    expansion_order_sequence = 2
    pilot_samples = 10
    collocation_ratio = .9
    allocation_control rip_sampling
    seed = 1237
    convergence_tolerance = .01
```

- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional Required (<i>Choose One</i>)	Description of Group Discrepancy Emulation Approach (Group 1)	Dakota Keyword distinct	Dakota Keyword Description Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,  
  multilevel_polynomial_chaos  
  expansion_order_sequence = 2  
  collocation_ratio = .9  
  orthogonal_matching_pursuit  
  discrepancy_emulation recursive

- [expansion_order_sequence](#)
- [collocation_ratio](#)

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion.

Specification

Alias: none

Argument(s): REAL

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		collocation_points- _sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional (<i>Choose One</i>)	Regression Algorithm (Group 1)	least_squares	Compute the coefficients of a polynomial expansion using least squares

		orthogonal_-matching_pursuit	Compute the coefficients of a polynomial expansion using orthogonal matching pursuit (OMP)
		basis_pursuit	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit ℓ_1 -minimization problem using linear programming.
		basis_pursuit_-denoising	Compute the coefficients of a polynomial expansion by solving the Basis Pursuit Denoising ℓ_1 -minimization problem using second order cone optimization.
		least_angle_-regression	Compute the coefficients of a polynomial expansion by using the greedy least angle regression (LAR) method.
		least_absolute_-shrinkage	Compute the coefficients of a polynomial expansion by using the LASSO problem.
	Optional	cross_validation	Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.
	Optional	ratio_order	Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

	Optional	response_scaling	Perform bounds-scaling on response values prior to surrogate emulation
	Optional	use_derivatives	Use derivative data to construct surrogate models
	Optional	tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional	reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional	max_solver_ - iterations	Maximum iterations in determining polynomial coefficients

Description

Set the number of points used to build a PCE via regression to be proportional to the number of terms in the expansion. To avoid requiring the user to calculate N from n and p , the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces `samples = 2N`). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`. The `use_derivatives` flag informs the regression approach to include derivative matching equations (limited to gradients at present) in the least squares solutions, enabling the use of fewer collocation points for a given expansion order and dimension (number of points required becomes $\frac{cN^o}{n+1}$).

7.2.68.3.3.134 `collocation_points_sequence`

- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: pilot_samples

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [least_absolute_shrinkage](#)
- [l2_penalty](#)

The l_2 penalty used when performing compressed sensing with elastic net.

Specification

Alias: none

Argument(s): REAL

Default: 0. (reverts to standard LASSO formulation)

Description

The l_2 penalty used when performing compressed sensing with elastic net.

7.2.68.3.3.148 cross_validation

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)

Use cross validation to choose the 'best' polynomial order of a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		noise_only	Restrict the cross validation process to estimating only the best noise tolerance.
	Optional		max_cv_order_candidates	Limit the number of cross-validation candidates for basis order

Description

Use cross validation to choose the 'best' polynomial degree of a polynomial chaos expansion. 10 fold cross validation is used to estimate the cross validation error of a total-order polynomial expansion for orders 1 through to order. The order chosen is the one that produces the lowest cross validation error. If there are not enough points to perform 10 fold cross validation then one-at-a-time cross validation will be performed.

7.2.68.3.3.149 noise_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)

- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [noise_only](#)

Restrict the cross validation process to estimating only the best noise tolerance.

Specification

Alias: none

Argument(s): none

Default: false

Description

By default, cross validation estimates both the best noise tolerance and the best candidate basis order. For reasons of reducing computational cost by reducing the number of candidate solves, the user may wish to restrict this process to estimating only the best noise tolerance.

Generally speaking, computing the best noise tolerance through cross validation mitigates issues with over-fitting the data. Computing the best candidate basis order can also mitigate overfitting, while also controlling levels of mutual coherence resulting from high-order Vandermonde-like matrix systems.

7.2.68.3.3.150 `max_cv_order_candidates`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [cross_validation](#)
- [max_cv_order_candidates](#)

Limit the number of cross-validation candidates for basis order

Specification

Alias: none

Argument(s): INTEGER

Default: ushort max

Description

When generating refinement candidates by advancing the upper bound used for a cross-validation range, the number of cross-validation can eventually become excessive and hamper algorithm progress. This control limits the maximum number of candidates, which when active, will increase the lower bound for this range as the upper bound is advanced.

7.2.68.3.3.151 ratio_order

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [ratio_order](#)

Specify a non-linear the relationship between the expansion order of a polynomial chaos expansion and the number of samples that will be used to compute the PCE coefficients.

Specification

Alias: none

Argument(s): REAL

Default: 1.

Description

When using regression type methods (specified with either `collocation_points` or `collocation_ratio`), a total-order expansion can be specified using `expansion_order`. To avoid requiring the user to calculate N from n and p), the `collocation_ratio` allows for specification of a constant factor applied to N (e.g., `collocation_ratio = 2`. produces samples = $2N$). In addition, the default linear relationship with N can be overridden using a real-valued exponent specified using `ratio_order`. In this case, the number of samples becomes cN^o where c is the `collocation_ratio` and o is the `ratio_order`.

7.2.68.3.3.152 response_scaling

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [response_scaling](#)

Perform bounds-scaling on response values prior to surrogate emulation

Specification

Alias: none

Argument(s): none

Default: use original data

Description

Particularly in multifidelity methods based on regression solutions at each level of a model hierarchy, scaling can be an issue since the magnitude of discrepancy data may decay rapidly and regression solvers may employ absolute tolerances in places.

By activating `response_scaling`, the set of response data used for each recovery is scaled to $[0,1]$ based on the minimum value and range of the data set. This prevents loss of accuracy due to imbalances in scale across model levels.

See Also

- [wasabi](#)
- [emulator](#)
- [ml_pce](#)

- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [use_derivatives](#)

Use derivative data to construct surrogate models

Specification

Alias: none

Argument(s): none

Default: use function values only

Description

The `use_derivatives` flag specifies that any available derivative information should be used in global approximation builds, for those global surrogate types that support it (currently, polynomial regression and the Surfpack Gaussian process).

However, its use with Surfpack Gaussian process is not recommended.

7.2.68.3.3.154 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): none

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.3.3.155 reuse_points

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [collocation_ratio](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

- [ml_pce](#)
- [expansion_order_sequence](#)
- [expansion_samples_sequence](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.159 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification**Alias:** import_points_file**Argument(s):** STRING**Default:** no point import from a file**Child Keywords:**

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.3.3.160 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)

- [import_build_points_file](#)
- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.

- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and `eval_id` (no `interface_id`), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1              0.9          1.1          0.0002      0.26          0.76
2              0.90009      1.1 0.0001996404857 0.2601620081 0.759955
3              0.89991      1.1 0.0002003604863 0.2598380081 0.760045
...
```

- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [annotated](#)

Selects annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

An annotated tabular file is a whitespace-separated text file with one leading header row of comments/column labels. Each subsequent row contains an evaluation ID and interface ID, followed by data for variables, or variables followed by responses, depending on context.

Default Behavior

By default, Dakota imports and exports tabular files in annotated format. The `annotated` keyword can be used to explicitly specify this.

Usage Tips

- To specify pre-Dakota 6.1 tabular format, which did not include `interface_id`, specify `custom_annotated` header `eval_id`
- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export an annotated top-level tabular data file containing a header row, leading `eval_id` and `interface_id` columns, and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    annotated
```

Resulting tabular file:

```
%eval_id interface          x1          x2          obj_fn nln_ineq_con_1 nln_ineq_con_2
1          NO_ID            0.9         1.1         0.0002      0.26          0.76
2          NO_ID            0.90009     1.1 0.0001996404857 0.2601620081 0.759955
3          NO_ID            0.89991     1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.165 freeform

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [freeform](#)

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
  freeform
```

Resulting tabular file:

```

      0.9          1.1          0.0002          0.26          0.76
0.90009          1.1 0.0001996404857 0.2601620081 0.759955
0.89991          1.1 0.0002003604863 0.2598380081 0.760045
...
```

7.2.68.3.3.166 active_only

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)

- [expansion_order_sequence](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.3.3.167 `orthogonal_least_interpolation`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation.

Specification

Alias: `least_interpolation oli`

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required		collocation_points_sequence	Sequence of collocation point counts used in a multi-stage expansion
	Optional		tensor_grid	Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.
	Optional		reuse_points	This describes the behavior of reuse of points in constructing polynomial chaos expansion models.
	Optional		import_build_points_file	File containing points you wish to use to build a surrogate

Description

Build a polynomial chaos expansion from simulation samples using orthogonal least interpolation. Unlike the other regression methods `expansion_order` cannot be set. OLI will produce the lowest degree polynomial that interpolates the data

7.2.68.3.3.168 `collocation_points_sequence`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [collocation_points_sequence](#)

Sequence of collocation point counts used in a multi-stage expansion

Specification

Alias: none

Argument(s): INTEGERLIST

Description

Each level entry of the `collocation_points_sequence` applies to one expansion within a multi-stage expansion. Current multi-stage expansions that support collocation point sequences include multilevel and multifidelity polynomial chaos and multilevel and multifidelity function train expansions.

If adaptive refinement is active, then this sequence specifies the starting point for each level within either an individual or integrated refinement approach.

A corresponding scalar specification is documented at, e.g., [collocation_points](#)

See Also

These keywords may also be of interest:

- [collocation_points](#)

7.2.68.3.3.169 `tensor_grid`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [tensor_grid](#)

Use sub-sampled tensor-product quadrature points to build a polynomial chaos expansion.

Specification

Alias: none

Argument(s): INTEGERLIST

Default: regression with LHS sample set (point collocation)

Description

The collocation grid is defined using a subset of tensor-product quadrature points: the order of the tensor-product grid is selected as one more than the expansion order in each dimension (to avoid sampling at roots of the basis polynomials) and then the tensor multi-index is uniformly sampled to generate a non-repeated subset of tensor quadrature points.

7.2.68.3.3.170 `reuse_points`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)

- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [reuse_points](#)

This describes the behavior of reuse of points in constructing polynomial chaos expansion models.

Specification

Alias: reuse_samples

Argument(s): none

Default: no sample reuse in coefficient estimation

Description

The `reuse_points` option controls the reuse behavior of points for various types of polynomial chaos expansions, including: `collocation_points`, `collocation_ratio`, `expansion_samples`, or `orthogonal_least_interpolation`. If any of these approaches are specified to create a set of points for the polynomial chaos expansion, one can specify `reuse_points` so that any points that have been previously generated (for example, from the `import_points` file) can be reused.

7.2.68.3.3.171 import_build_points_file

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

File containing points you wish to use to build a surrogate

Specification

Alias: import_points_file

Argument(s): STRING

Default: no point import from a file

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description

	Optional (<i>Choose One</i>)	Tabular Format (Group 1)	custom_annotated	Selects custom-annotated tabular file format
			annotated	Selects annotated tabular file format
			freeform	Selects freeform file format
	Optional		active_only	Import only active variables from tabular data file

Description

The `import_build_points_file` allows the user to specify a file that contains a list of points and truth model responses used to construct a surrogate model. These can be used by all methods that (explicitly, e.g. surrogate-based optimization, or implicitly, e.g. efficient global optimization) operate on a surrogate. In particular, these points and responses are used in place of truth model evaluations to construct the initial surrogate. When used to construct surrogate models or emulators these are often called build points or training data.

Default Behavior

By default, methods do not import points from a file.

Usage Tips

Dakota parses input files without regard to whitespace, but the `import_build_points_file` must be in one of three formats:

- `annotated` (default)
- `custom_annotated`
- `freeform`

Examples

```
method
  polynomial_chaos
    expansion_order = 4
    import_build_points_file = 'dakota_uq_rosenbrock_pce_import.annot.pts.dat'
```

7.2.68.3.3.172 `custom_annotated`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)

- [custom_annotated](#)

Selects custom-annotated tabular file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		header	Enable header row in custom-annotated tabular file
	Optional		eval_id	Enable evaluation ID column in custom-annotated tabular file
	Optional		interface_id	Enable interface ID column in custom-annotated tabular file

Description

A custom-annotated tabular file is a whitespace-separated text file typically containing row data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well. Custom-annotated allows user options for whether `header` row, `eval_id` column, and `interface_id` column appear in the tabular file, thus bridging `freeform` and (fully) `annotated`.

Default Behavior

The `annotated` format is the default for tabular export/import. To control which header row and columns are in the input/output, specify `custom_annotated`, followed by options, in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were in free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a custom-annotated tabular file in Dakota 6.0 format, which contained only header and eval_id (no interface_id), and data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    custom_annotated header eval_id
```

Resulting tabular file:

```
%eval_id      x1          x2          obj_fn  nln_ineq_con_1  nln_ineq_con_2
1              0.9          1.1          0.0002         0.26           0.76

Selects freeform file format

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Default: annotated format

Description

A freeform tabular file is whitespace-separated text file with no leading header row and no leading columns. Most commonly, each row contains data for variables, or variables followed by responses, though the format is used for other tabular exports/imports as well.

Default Behavior

The `annotated` format is the default for tabular export/import. To change this behavior, specify `freeform` in the relevant export/import context.

Usage Tips

- Prior to October 2011, calibration and surrogate data files were free-form format. They now default to `annotated` format, though `freeform` remains an option.
- When importing tabular data, a warning will be generated if a specific number of data are expected, but extra is found and an error generated when there is insufficient data.
- In `freeform`, the `num_rows` x `num_cols` total data entries may be separated with any whitespace including spaces, tabs, and newlines. In this format, vectors may therefore appear as a single row or single column (or mixture; entries will populate the vector in order).
- Some TPLs like SCOLIB and JEGA manage their own file I/O and only support the `freeform` option.

Examples

Export a freeform tabular file containing only data for variables and responses. Input file fragment:

```
environment
  tabular_data
    tabular_data_file = 'dakota_summary.dat'
    freeform
```

Resulting tabular file:

```
      0.9          1.1          0.0002          0.26          0.76

7.2.68.3.3.178 `active_only`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [orthogonal_least_interpolation](#)
- [import_build_points_file](#)
- [active_only](#)

Import only active variables from tabular data file

Topics

This keyword is related to the topics:

- [file_formats](#)

Specification

Alias: none

Argument(s): none

Description

By default, files for tabular data imports are expected to contain columns for all variables, active and inactive. The keyword `active_only` indicates that the file to import contains only the active variables.

This option should only be used in contexts where the inactive variables have no influence, for example, building a surrogate over active variables, with the state variables held at nominal. It should not be used in more complex nested contexts, where the values of inactive variables are relevant to the function evaluations used to build the surrogate.

7.2.68.3.3.179 askey

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [askey](#)

Select the standardized random variables (and associated basis polynomials) from the Askey family that best match the user-specified random variables.

Specification

Alias: none

Argument(s): none

Default: extended (Askey + numerically-generated)

Description

The Askey option employs standard normal, standard uniform, standard exponential, standard beta, and standard gamma random variables in a transformed probability space. These selections correspond to Hermite, Legendre, Laguerre, Jacobi, and generalized Laguerre orthogonal polynomials, respectively.

Specific mappings for the basis polynomials are based on a closest match criterion, and include Hermite for normal (optimal) as well as bounded normal, lognormal, bounded lognormal, gumbel, frechet, and weibull (sub-optimal); Legendre for uniform (optimal) as well as loguniform, triangular, and bin-based histogram (sub-optimal); Laguerre for exponential (optimal); Jacobi for beta (optimal); and generalized Laguerre for gamma (optimal).

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

Specification

Alias: none

Argument(s): none

Default: PCE coefficients correspond to unnormalized basis polynomials

Description

The normalized specification requests output of PCE coefficients that correspond to normalized orthogonal basis polynomials

7.2.68.3.3.182 `export_expansion_file`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [export_expansion_file](#)

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file

Specification

Alias: none

Argument(s): STRING

Description

Export the coefficients and multi-index of a Polynomial Chaos Expansion (PCE) to a file. The multi-index written will be sparse. Specifically the expansion will consist only of the indices corresponding to the non-zero coefficients of the PCE.

7.2.68.3.3.183 `diagonal_covariance`

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [ml_pce](#)
- [diagonal_covariance](#)

Display only the diagonal terms of the covariance matrix

Specification

Alias: none

Argument(s): none

Default: `diagonal_covariance` for response vector > 10 ; else `full_covariance`

Description

With a large number of responses, the covariance matrix can be very large. `diagonal_covariance` is used to suppress the off-diagonal covariance terms (to save compute and memory resources and reduce output volume).

7.2.68.3.3.184 `full_covariance`

- [Keywords Area](#)
- [method](#)

Automatic polynomial order refinement

Specification

Alias: none

Argument(s): none

Default: no refinement

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	p-refinement Type (Group 1)	uniform	Refine an expansion uniformly in all dimensions.
			dimension_adaptive	Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to have higher 'importance'.

Description

The `p_refinement` keyword specifies the usage of automated polynomial order refinement, which can be either `uniform` or `dimension_adaptive`.

The `dimension_adaptive` option is supported for the tensor-product quadrature and Smolyak sparse grid options and `uniform` is supported for tensor and sparse grids as well as regression approaches (`collocation_points` or `collocation_ratio`).

Each of these refinement cases makes use of the `max_iterations` and `convergence_tolerance` method independent controls. The former control limits the number of refinement iterations, and the latter control terminates refinement when the two-norm of the change in the response covariance matrix (or, in goal-oriented approaches, the two-norm of change in the statistical quantities of interest (QOI)) falls below the tolerance.

The `dimension_adaptive` case can be further specified to utilize `sobol`, `decay`, or `generalized` refinement controls. The former two cases employ anisotropic tensor/sparse grids in which the anisotropic dimension preference (leading to anisotropic integrations/expansions with differing refinement levels for different random dimensions) is determined using either total Sobol' indices from variance-based decomposition (`sobol` case: high indices result in high dimension preference) or using spectral coefficient decay rates from a rate estimation technique similar to Richardson extrapolation (`decay` case: low decay rates result in high dimension preference). In these two cases as well as the `uniform` refinement case, the `quadrature_order` or `sparse_grid_level` are ramped by one on each refinement iteration until either of the two convergence controls is satisfied. For the `uniform` refinement case with regression approaches, the `expansion_order` is ramped by one on each iteration while the oversampling ratio (either defined by `collocation_ratio` or inferred from `collocation_points` based on the initial expansion) is held fixed. Finally, the `generalized dimension_adaptive` case is the default adaptive approach; it refers to the generalized sparse grid algorithm, a greedy approach in which candidate index sets are evaluated for their impact on the statistical QOI, the most influential sets are selected and used to generate additional candidates, and the index set frontier of a sparse grid is evolved in an unstructured and goal-oriented manner (refer to User's Manual PCE descriptions for additional specifics).

For the case of `p_refinement` or the case of an explicit nested override, Gauss-Hermite rules are replaced with Genz-Keister nested rules and Gauss-Legendre rules are replaced with Gauss-Patterson nested rules, both of which exchange lower integrand precision for greater point reuse.

	Required/Optional Required (<i>Choose One</i>)	Description of Group Dimension Adaptivity Estimation Approach (Group 1)	Dakota Keyword sobol	Dakota Keyword Description Estimate dimension preference for automated refinement of stochastic expansion using total Sobol' sensitivity indices.
			decay	Estimate spectral coefficient decay rates to guide dimension-adaptive refinement.
			generalized	Use the generalized sparse grid dimension adaptive algorithm to refine a sparse grid approximation of stochastic expansion.

Description

Perform anisotropic expansion refinement by preferentially adapting in dimensions that are detected to hold higher 'importance' in resolving statistical quantities of interest.

Dimension importance must be estimated as part of the refinement process. Techniques include either sobol or generalized for stochastic collocation and either sobol, decay, or generalized for polynomial chaos. Each of these automated refinement approaches makes use of the max_iterations and convergence_tolerance iteration controls.

7.2.68.3.3.189 sobol

Sample allocation approach for multifidelity expansions

Specification

Alias: none

Argument(s): none

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Multifidelity Sample Allocation Control (Group 1)	greedy	Sample allocation based on greedy refinement within multifidelity polynomial chaos

Description

Multifidelity surrogate approaches, including polynomial chaos, stochastic collocation, and function train, can optionally employ an integrated greedy competition across the model sequence, where each model index can supply one or more refinement candidates which are competed to determine the candidate with the greatest impact on the QoI statistics per unit cost. This greedy competition implicitly determines the optimal sample allocation across model indices.

Default Behavior

The default, when `allocation_control` is not specified, is to compute or adapt separately for each model index (individual instead of integrated refinement).

7.2.68.3.3.194 [greedy](#)

- [Keywords Area](#)
- [method](#)
- [bayes_calibration](#)
- [wasabi](#)
- [emulator](#)
- [mf_pce](#)
- [allocation_control](#)
- [greedy](#)

Sample allocation based on greedy refinement within multifidelity polynomial chaos

Specification

Alias: none

Argument(s): none

Description

Multifidelity polynomial chaos supports greedy refinement strategies, spanning regression and projection approaches for computing expansion coefficients. The key idea is that each level of the model hierarchy being approximated can generate one or more candidates for refinement. These candidates are competed against each other within a unified competition, and the candidate that induces the largest change in the statistical QoI (response covariance by default, or results of any $z/p/\beta/\beta^*$ level mappings when specified), normalized by relative cost of evaluating the candidate, is selected and then used to generate additional candidates for consideration at its model level.

Examples

The following example of greedy multifidelity regression starts from a zeroth-order reference expansion (a constant) for each level, and generates candidate refinements for each level that are competed in an integrated greedy competition. The number of new samples for the incremented candidate expansion order is determined from the collocation ratio. In this case, the number of candidates for each level is limited to one uniform refinement of the current expansion order.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement uniform
  expansion_order_sequence = 0
  collocation_ratio = .9 seed = 160415
  orthogonal_matching_pursuit
  convergence_tolerance 1.e-2
```

The next example employs generalized sparse grids within a greedy multifidelity competition. Each modeling level starts from a level 0 reference grid (a single point) and generates multiple admissible index set candidates. The full set of candidates across all model levels is competed within an integrated greedy competition, where the greedy selection metric is the induced change in the statistical QoI, normalized by the aggregate simulation cost of the index set candidate. In this case, there are multiple candidates for each model level and the number of candidates grows rapidly with random dimension and grid level.

```
method,
  model_pointer = 'HIERARCH'
  multifidelity_polynomial_chaos
  allocation_control greedy
  p_refinement dimension_adaptive generalized
  sparse_grid_level_sequence = 0 unrestricted
  convergence_tolerance 1.e-8
```

- [wasabi](#)
- [emulator](#)
- [mf_pce](#)
- [discrepancy_emulation](#)

Formulation for emulation of model discrepancies.

Specification

Alias: none

Argument(s): none

Default: distinct

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Required (<i>Choose One</i>)	Discrepancy Emulation Approach (Group 1)	distinct	Distinct formulation for emulation of model discrepancies.
			recursive	Recursive formulation for emulation of model discrepancies.

Description

In many uncertainty quantification approaches, model discrepancies are emulated using, e.g., polynomial chaos, stochastic collocation, or Gaussian process models. Two formulations are available for this emulation:

1. `distinct` emulation (default), in which we directly approximate the difference or ratio between the evaluations of two models or solution levels.
2. `recursive` emulation (experimental option), in which we approximate a difference or ratio among the new model evaluation and the emulator approximation of the previous model.

The latter approach is a form of hierarchical emulation in which we emulate the surplus between the previous emulator and the new modeling level. This approach has a few advantages: (i) it reduces bias by correcting for emulation errors that occur at previous levels, and (ii) it does not require paired model evaluations for each discrepancy level, which reduces cost, allows for disparate sample points, and simplifies data imports.

On the other hand, its primary disadvantage is that the aggregate emulation is only as good as its weakest link, in that a poor emulator recovery can create difficulty in accurately resolving discrepancies that are recursively dependent on it. Thus, the `distinct` approach may tend to be more expensive in exchange for greater robustness.

Examples

```
method,
  multilevel_polynomial_chaos
  expansion_order_sequence = 2
  collocation_ratio = .9
  orthogonal_matching_pursuit
  discrepancy_emulation recursive
```

- [restricted](#)

Restrict the growth rates for nested and non-nested rules can be synchronized for consistency.

Specification

Alias: none

Argument(s): none

Default: restricted (except for generalized sparse grids)

Description

In the quadrature and sparse grid cases, growth rates for nested and non-nested rules can be synchronized for consistency. For a non-nested Gauss rule used within a sparse grid, linear one-dimensional growth rules of $m = 2l + 1$ are used to enforce odd quadrature orders, where l is the grid level and m is the number of points in the rule. The precision of this Gauss rule is then $i = 2m - 1 = 4l + 1$. For nested rules, order growth with level is typically exponential; however, the default behavior is to restrict the number of points to be the lowest order rule that is available that meets the one-dimensional precision requirement implied by either a level l for a sparse grid ($i = 4l + 1$) or an order m for a tensor grid ($i = 2m - 1$). This behavior is known as "restricted growth" or "delayed sequences." To override this default behavior in the case of sparse grids, the `unrestricted` keyword can be used; it cannot be overridden for tensor grids using nested rules since it also provides a mapping to the available nested rule quadrature orders. An exception to the default usage of restricted growth is the `dimension_adaptive p_refinement` generalized sparse grid case described previously, since the ability to evolve the index sets of a sparse grid in an unstructured manner eliminates the motivation for restricting the exponential growth of nested rules.

Use a tensor-product index set to construct a polynomial chaos expansion. That is for a given order p keep all terms with d -dimensional multi index $\mathbf{i} = (i_1, \dots, i_d)$ that satisfies

$$\max(i_1, \dots, i_d) \leq p$$

Argument(s): none

Description

Use the traditional total-order index set to construct a polynomial chaos expansion. That is for a given order p keep all terms with a d -dimensional multi index $\mathbf{i} = (i_1, \dots, i_d)$ that satisfies

$$\sum_{k=1}^d i_k \leq p$$

Child Keywords:

	Required/Optional	Description of Group	Dakota Keyword	Dakota Keyword Description
	Optional		advancements	The maximum number of steps used to expand a basis step.
	Optional		soft_convergence_limit	The maximum number of times no improvement in cross validation error is allowed before the algorithm is terminated.

Description

Use adaptive basis selection to choose the basis terms in a polynomial chaos expansion. Basis selection uses compressed sensing to identify a initial set of non zero PCE coefficients. Then these non-zero terms are expanded a set number of times (we suggest 3) and compressed sensing is then applied to these three new index sets. Cross validation is used to choose the best candidate basis. The best basis is then restricted again to the non-zero terms and expanded until no improvement can be gained by adding additional terms.
